MICROBUFFER WILL SPEED UP ANY PROGRAM THAT REQUIRES PRINTING.

MICROBUFFER ALLOWS YOU TO PRINT AND PROCESS SIMULTANEOUSLY.

Now you don't have to wait for the printer to finish before you can use your computer again.

YOU CAN DUMP PRINTING DATA DIRECTLY TO MICROBUFFER.

Unlike your printer, Microbuffer accepts data as fast as your computer can send it. So there's never a bottleneck.

Microbuffer first stores the data in its own memory buffer and then takes control of your printer. This frees the computer for more productive functions.

Additional output may be dumped to the buffer at any time and it will be printed in turn.

THERE IS A MICROBUFFER FOR ANY PRINTER/COMPUTER COMBINATION.

Microbuffers are available in Centronics-compatible parallel or RS-232C serial versions.

FOR APPLE II COMPUTERS, Microbuffer II features on-board

firmware for text formatting and advanced graphics dump routines. Both serial and parallel versions have very low power consumption. Special functions include Basic listing formatter, self-test, buffer zap, and transparent and maintain modes. The 16K model is priced at \$259 and the 32K, at \$299.

FOR EPSON PRINTERS, Microbuffer is \$159 in either an 8K serial or a 16K parallel version. The serial buffer supports both hardware handshaking and XON-XOFF/ETC-ACK software handshaking at baud rates up to 19,200. Both Epson interfaces are compatible with all Epson commands including GRAFTRAX-80 and GRAFTRAX-80+.

ALL OTHER PRINTER/COMPUTER COMBINATIONS are served by the in-line, stand-alone Microbuffers. Both serial and parallel versions are expandable up to 256K. The serial stand-alone will support different input and output baud rates and handshake protocol. The 32K model starts at \$299, 64K for \$349. 64K add-ons for up to a total of 256K are just \$179.

When you think of how much time Microbuffer will save, can you afford to *not* have one?

SIMPLE TO INSTALL.

Microbuffer II is slot-independent. It will fit directly inside the Apple II in any slot except zero.

Microbuffer for your Epson mounts easily in the existing auxiliary slot directly inside the printer.

The stand-alone Microbuffer is installed in-line between virtually any printer and computer.

MICROBUFFER FROM PRACTICAL PERIPHERALS.

Practical Peripherals is dedicated to establishing new industry standards for product performance.

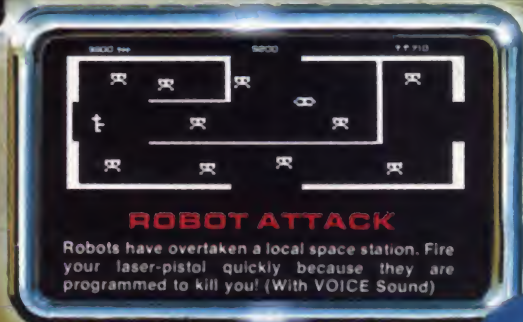

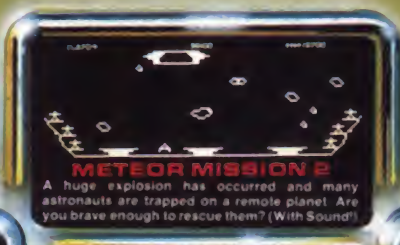

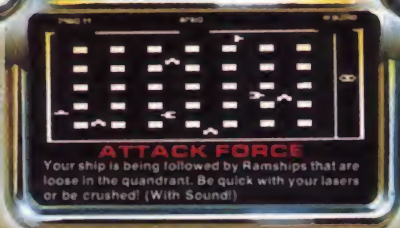

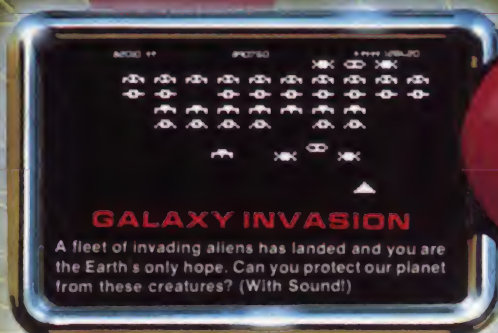

The un-retouched photo at left has been enlarged to demonstrate Microbuffer's exact workmanship and precise attention to detail. Specifications demand that each board undergo 36 separate tests and inspections before it can leave the factory.

Ask your dealer for a demonstration of the most practical, most successful new product of the year — Microbuffer.

where to send it

All **editorial material**, including article submissions, press releases, and products for evaluation should be sent to:

Creative Computing
 39 E. Hanover Ave.
 Morris Plains, NJ 07950

Correspondence regarding other Creative Computing products and publications should also be sent to the Morris Plains address.

Correspondence related to **advertising**, including ad copy, questions on billing, and requests for rates, should be sent to:

Advertising Department
 Creative Computing
 Ziff-Davis Publishing Co.
 One Park Ave.
 New York, NY 10016

Correspondence regarding **subscriptions**, including orders, changes of address, and problems should be sent to:

Creative Computing
 P.O. Box 5214
 Boulder, CO 80321

Your help in choosing the correct address for your correspondence is appreciated. An incorrectly addressed letter or package can take as long as several weeks to reach its proper destination.

subscriptions

All subscriptions orders and other correspondence related to subscriptions should be addressed to:

Creative Computing
 P.O. Box 5214
 Boulder, Colorado 80321.

Foreign subscriptions must be accompanied by payment in U.S. currency.

Subscription prices:

U.S.	Canada	Foreign
1 year \$24.97	1 year 29.97	1 year 34.97
2 years 43.97	2 years 53.97	2 years 63.97
3 years 57.97	3 years 72.97	3 years 87.97

Airmail delivery on foreign subscriptions is available for a one-year period only at \$75.00 additional for mail to Asia and Australia, and \$50.00 additional for all other foreign.

Subscribers in the United Kingdom may send payment in sterling to:

Hazel Gordon
 27 Andrew Close
 Stoke Golding
 Nuneaton, CV13 6EL

Please allow at least eight weeks for change of address. Include old address as well as new—enclosing if possible an address label from a recent issue.

attention authors

Creative Computing will not be responsible for the return of unsolicited manuscripts, cassettes, floppy disks, program listings, etc. not submitted with a self-addressed, stamped envelope.

**In an age when new standards are constantly emerging,
one disk consistently meets or exceeds them all.**

Maxell. The Gold Standard.

Not all disks are created equal. Some are better than others. To find out what's best for you, look for Maxell disks. They now carry the Gold Standard symbol of quality. It's your assurance Maxell disks meet or exceed every definition of quality. No matter who establishes it. We've earned this universal superiority by never relaxing our uniquely demanding quality control. Every aspect of manufacturing is checked, then checked again.

Your benefits are many. Take the perpetual problem of drop-outs. A drop-out is a tiny defect that wastes time and degrades computer accuracy and performance. Now that you understand what a drop-out is, forget it. Maxell disks don't have any. Each disk comes to you certified

drop-out free at the time of manufacture. You can depend on this quality protecting your valuable programs and programming time, indefinitely. We've run disks over ten million passes under conditions designed to find weak points and wear. We couldn't. And you won't.

There is a Maxell disk for the floppy system you use, or plan to use. Check your computer's instructions. Or write for our complete, highly informative brochure.

When you set the Gold Standard as your level of quality, you'll benefit from improved disk performance, immediately. Bank on it.

Intelligential Intelligibility

Dear Editor:

I loved the program in the June 1982 *Creative Computing* "Machine Intelligence: A Function of Human Ingenuity" by C.J. Georgiou. There were, however, a couple of typographical errors:

```
960 IF(V > 0) and V <= N) GOTO 980
1140 IF B=1 THEN Q1=0
```

For those of your readers who have personal computers with 80 characters (I have the Super Pet) I have made the following adjustments

```
110 DIM H(20,20), A(8), B(8)
151 PRINT "BE PATIENT IT TAKES TIME!"
152 PRINT
153 PRINT "TO CHECK WEIGHTS IN PROGRESS
PRESS < RUN/STOP > FOLLOWED BY GOTO 1600"
154 PRINT
160 INPUT "ENTER SIZE OF BOARD < UP TO 20 >," N
780 PRINT "-----": PRINT
1635 IF N = 20 THEN 1650
1640 PRINT delete second PRINT
delete lines 1670 — 1720 Replace with
1670 S1$ = STR$(S1)
1680 S2$ = " " + S1$ (4 spaces)
1690 PRINT RIGHT$(S2$,4);
1805 PRINT
1810 INPUT "TRY AGAIN";Q$
1820 IF "Y" = LEFT$(Q$,1) THEN 160
1830 END
```

Teed at Coffey

Dear Editor:

As an avid reader of *Creative Computing*, I find the software evaluations most informative. However, I feel I must comment on Michael Coffey's review of *GraForth II*, "A Graphic Language That's Downright Forthright," which appeared in the July issue.

Mr. Coffey mentions the ability to add new words (commands) to *GraForth* as a method to personalize the language. This is belittling one of the most powerful capabilities of Forth-like languages. If this capability were available in Basic, it would be used for more than just giving PRINT the pseudonym of P. In Forth-like languages, one builds commands until the final command built is the finished program. The capabilities of this type of system is awesome.

Another area where I must differ with Mr. Coffey is in the area of printer support and paddle support. In the documentation for *GraForth* supplied by Insoft there is a word (program) called PRINT.BUFFER which will print text for

Another area where I must differ with Mr. Coffey is in the area of printer support and paddle support. In the documentation for *GraForth* supplied by Insoft there is a word (program) called PRINT.BUFFER which will print text for the user. I have used this word, which is only ten lines long,

with great success. I have even added it to the basic list of words available in *GraForth*. (Additions to the language can be permanent). Paddle support is also provided by Insoft in the form of the word PADDLE, a three line program.

Additional areas which should be mentioned are sound generation and documentation. *GraForth* has a quite good and easy to use sound generator. Seven different voices are available.

The documentation which comes from Insoft is superb and will get a user up and running shortly after ripping open the package. The quality of the documentation should have received some comment for the review to be complete.

I feel that omitting the areas mentioned above is slighting an excellent product unfairly. Having used *GraForth* for the last month and a half, I have found coding in the language a joy.

John-Francis Mergen
823 Quince Orchard Blvd. #34
Gaithersburg, MD 20878

Grafix

Dear Editor:

Please note this error in your July 1982 issue:

In the "Graphics Package for the Apple II" by Christopher Hansen on p. 112, there is an error in line 10670. The variable in line 10670, which is shown as C, should be C\$.

Otherwise the program runs fine.

Keep up the good work—love your magazine and my Apple II.

Bob Baker
2 High Grove Rd.
S. Yarmouth, MA 02664

Let's Get Normal

Dear Editor:

In the April 1982 *Creative Computing* page 176 Marvin Weingast suggests an interesting method for approximating a normal distribution. Unfortunately his program does not do what he describes. He says, for example, 12.35% of the time $X = 1.5 \cdot (A + B - 1)$ where A and B are uniformly distributed random variables which vary from 0 to 1. But in the program line 50 he uses A to determine the times when this formula should be used. Thus to get to $X = 1.5 \cdot (A + B - 1)$ A must be between .8765 and 1. B still varies between 0 and 1. The resulting distribution is quite different from that intended.

The variable used for the test must be independent of the values used in the functions.

To correct the program:

In line 30 Add D=RND(1)

Change Lines 40 and 50 to read

40 IF D < .8765 THEN X=2*(A+B+C-1.5)

50 IF D = > .8765 THEN X=1.5*(A+B-1)

Dallas, TX 75203

First, the *IBM Personal Computer*, The Next Step . . .

Tecmar

SYSTEM EXPANSION with a complete Expansion Chassis providing six additional system slots, a separate power supply and styling that complements the IBM system.

MEMORY EXPANSION in 64K, 128K, 192K and 256K Byte increments of Dynamic RAM with parity, 32K Bytes of Static RAM, 32K Bytes of CMOS RAM with battery backup, or up to 128K Bytes of Read Only Memory.

PRACTICAL EXPANSION with two Serial ports and one Parallel port on a single board, or a Time of Day calendar with battery backup, a Voice Synthesizer with vocabulary in ROM and phoneme speech generation, even a BSR X10™ device controller for lights and appliances.

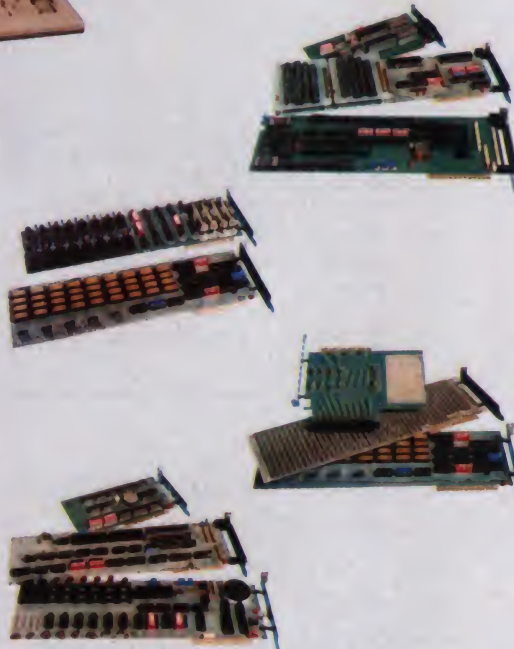

DISK EXPANSION through the addition of a five or ten megabyte Winchester disk. The disk options come enclosed in the TECMAR Expansion Chassis, providing additional expansion slots as well as Winchester disk storage. This approach assures you of unmatched system expandability for nearly any application.

FUNCTIONAL EXPANSION is also available with TECMAR Speed Disk™ and print Spooling Software that give new functionality to memory options.

UNMATCHED EXPANSION for the serious IBM Personal Computer user through these and the many other TECMAR Expansion products available through participating COMPUTERLAND stores, and other fine computer retailers nationwide.

The TECMAR Expansion series is the first and only, complete line of expansion options available for the IBM Personal Computer.

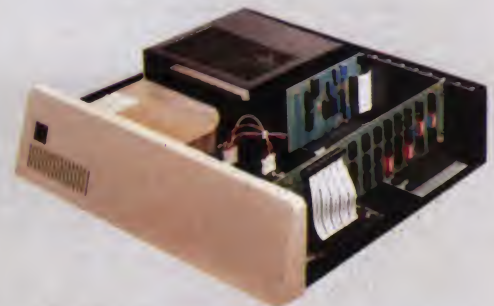

Now totaling over twenty-five separate options, the TECMAR series gives you the broadest range of expansion available for your IBM Personal Computer.

LABORATORY/INDUSTRIAL EXPANSION through an IEEE 488 interface, the Lab Tender with an 8 bit A/D and D/A, or the Lab Master for 12 bit A/D and D/A, a two axis Stepper Motor Controller, or the Parallel Digital-In/Digital-Out Base Board™, Video Digitization with Video VanGogh™.

DEVELOPMENT EXPANSION using an E+EEPROM programmer, Protozoa prototyping boards or a TECMAR Extender card.

NEW PRODUCTS are currently under development with many soon to be announced. At present shipping 26 unique IBM add-on products, we are still looking for needs to meet. If you have an need for a new product for the IBM Personal Computer, and would like to ask us about it, give a call on our Product Input Hotline at (216) 464-8317.

For IBM Personal Computer Expansion, TAKE THE NEXT STEP . . .

More Than Drill and Practice

Annie Fox

creative computing

SOFTWARE PROFILE

Name: Elementary Mathematics
Classroom Learning System
Set 1-Whole Numbers

Type: CAI

System: 48K Apple, 3.3 DOS

Format: Disk

Language: Applesoft Basic

Summary: great

Price: \$495

Manufacturer:

Sterling Swift
1600 Fortview Rd.
Austin, TX 78704

Specific hardware requirements are prominently displayed on page one of the manual (unlike some software products which print system requirements only on the diskette label).

The manual is nicely printed (typeset) and extremely well organized. Clearly defined objectives as well as the step-by-step sequence of events for each lesson are provided. One particularly welcomed addition is the abundance of screen display illustrations.

***Help comes in the form
of a little droid-like
character who
skitters across the
screen and gives the
student just the
right piece of
information at the
appropriate time.***

Boy, am I excited! After looking at "educational" software since 1977 I have finally seen a program for microcomputers which is really worth something. I'm referring to Sterling Swift's *Elementary Mathematics Classroom Learning System*. I was ecstatic to find that somebody is creating quality educational software. Although this review pertains to the English Language Version of Set 1 - Elementary Mathematics (Whole Numbers), Sterling Swift also publishes another set dealing with fractions and decimals. Both sets are also available in Spanish.

To begin with the documentation is an outstanding "user manual" which presupposes no prior knowledge of computers. The binder which accompanies the set of six diskettes contains everything a teacher needs to know about using the package.

The simplest of instructions ("Now place the Addition disk in Drive #1 and press RETURN") tells the teacher how to create a file for each student on each of the math disks.

Once all of the students have been entered (new students can easily be added and old ones deleted) the student is ostensibly on his own.

The student chooses a math operation (strand) on which to work, by selecting the Addition, Subtraction, Multiplication or Division diskette and placing it in drive #1. (I personally feel that students should be competent in operating computers and responsible for loading disks. However, since the disks from this package are not copyable and replacement disks are sold for \$9.95 each after the 90 day warranty period expires, some schools might wish to prevent potential disasters by not allowing the students to handle the disks at all).

Once the disk has been loaded, the student is asked to log in with his name, group name and secret password of his own creation. This procedure insures the authenticity of the student's work and the confidentiality of his records.

The student takes a diagnostic test which enables the program to place him at the appropriate achievement level when he first enters the system. The first portion of the test is timed; the second is not. In neither case does the student receive any feedback for individual responses during the testing session.

When the competency test is over, the student is informed of the number of correct responses he gave. The computer then indicates at which of the six lessons within the strand the student is to com-

THE LEADING EDGE IN PRINTERS

ONE GREAT LINE. ONE GREAT WARRANTY.

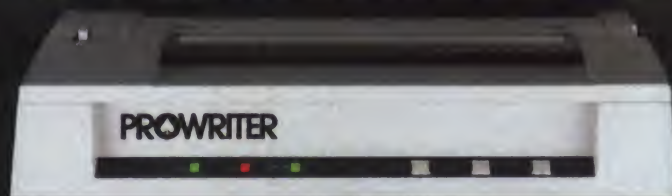

Finally, there's one full family of printers that covers every business or word processing application—all from C. Itoh, a company known for packing more product into less price; and all distributed exclusively by Leading Edge, a company known for searching out and providing that very thing. Which means that one call to one source can get you any printer, any time you need it, for any purpose. All backed by a full years' warranty from Leading Edge. (Try *that* on any other line of printers.)

THE PRO'S.

The Prowriters: business printers—and more. The “more” is a dot-matrix process with more dots. It gives you denser, correspondence quality copy (as opposed to business quality copy, which looks like a bad job of spray-painting).

Prowriter: 120 cps. 80 columns dot matrix compressable to 136. 10" carriage. Parallel or serial interface.

Prowriter 2: Same as Prowriter, except 15" carriage allows full 136 columns in normal print mode. Parallel or serial interface.

THE STAR.

The Starwriter F-10. In short (or more precisely, in a sleek 6" high, 30-pound unit), it gives you more of just about everything—except bulk and noise—than any other printer in its price range. It's a 40 cps letter-quality daisy-wheel with a bunch of built-in functions to simplify and speed up word processing. It plugs into almost any micro on the market, serial or parallel.

THE MASTER.

The Printmaster F-10. Does all the same good stuff as the Starwriter except, at 55 cps, the Master does it faster.

*Distributed Exclusively by Leading Edge Products, Inc., 225 Turnpike Street, Canton, Massachusetts 02021.
Call: toll-free 1-800-343-6833; or in Massachusetts call collect (617) 828-8150. Telex 951-624.*

Lessons

The Lesson section, complete with a built-in tutorial is where this math package really shines. It is the closest thing I've ever seen to having a good teacher standing right there beside the student, leading him through a math problem step by step.

I have test driven other programs which claimed to be "educational" and some

***The most salient
feature of this
package is its
consistent quality.***

which even had the audacity to call themselves "instructional," but for the most part they were only effective in the area of drill and practice. This *Elementary Mathematics Classroom Learning System* actually does some teaching. Here the student who is having difficulty with the concept behind the math problem can receive some valuable help from the computer.

The help comes in the form of a little droid-like character who skitters across the screen and gives the student just the right piece of information at the appropriate time. For example, if the student is faced with a subtraction problem such as:

$$\begin{array}{r} 96 \\ - 9 \\ \hline \end{array}$$

and he places an incorrect digit in the ones column, the computer will draw out the 96 so that it is re-written as nine tens and six ones. Then the little droid will walk across the top of the screen, and "borrow" one of the tens (changing the 9 to an 8) and "carry" it over to the six in

the form of a little 1, placing it directly beside the six so it becomes sixteen. He will then point to a message which simply states "I traded a ten for 10 ones in the top number."

Tutorials

The tutorial sections of each of the four strands are equally well presented. For example, if the student is having trouble with 4×5 , our droid friend obliges by transforming it to an addition problem complete with four groups of five squares which the student can physically touch and count if he likes. It would have been an absolute pleasure for a non-math person like myself to have learned it like this back in elementary school. Who knows what mathematical heights I might have reached?

After the lesson has been completed, the student is given a report of his score and the option of repeating the drill cycle. If he chooses to end the lesson, a timed mastery check cycle begins. Each lesson objective has a "mastery criterion" ratio (correct responses/total problems) which must be achieved before he can advance to the next lesson. As always, the student is given a report of his performance and advised as to which lesson he will be working next time.

Although the graphics in this package are not in color (which seems a shame since it was written for the Apple), they are excellent and the animation is really delightful. I happily noted the use of upper- and lowercase text as well as inverse video for a varied display.

Also, for the sake of variety, the entire screen is used and you never know where the droid and the next problem will pop up next. Likewise, the acknowledgements and the accompanying animation which the student receives for correct responses are varied and randomized which adds a nice element of anticipation.

Games

Provided along with the Management disk and the four mathematics disks is a Games disk which contains two games, Slam Dunk and Space War. These games deserve special mention because as math

games go they are really quite good. They are designed to provide further opportunity for mastery of math skills.

Slam Dunk is a basketball-type one-person competition in which the player's ability to answer math problems (of the operation of his choice) determines the outcome of the shot to the basket. Get the answer right and the ball sails through, miss and it bounces off the backboard.

Each game lasts for a 30 second period (which is an excellent feature in a classroom situation where without a time limit a student might not have the self-control to give his classmates a turn). Incorrect response causes the clock to stop and the correct answer to be displayed on the screen.

When the clock starts again, the next problem the student must solve is the same as the one he just missed. The student's performance is rated on the number of correct responses given within the game period.

The second game is called Space War, and is not nearly as trite as the title sounds. In this game, two players race to solve identical addition and subtraction problems by dialing and entering the correct digits with the Apple game paddles. Incorrect digits are not accepted.

The first player to solve the problem correctly gets one point and the opportunity

to deliver a phaser blast to his opponent's ship. Three points wins the game. It's a good test of math skills in addition to being great fun.

Although Slam Dunk can be used by any student who first signs on to the system, because the problems in Space War are more difficult, Sterling Swift recommends that it be played only by students who have demonstrated mastery of a strand.

How Many To Buy

So if you are interested in this kind of set up for your school what do you need? Well, according to the table included in the documentation, if you have between one and four computers (and we'll assume you already have them), you can get by with one set of diskettes.

If you have from five to eight computers you need two sets. And if you have nine to twelve computers you need three sets.

The first set costs \$495 and each additional set (of the same version and "purchased and billed to the same account") is \$295. This package is not inexpensive. School budgets being what they are, it probably would represent a sizable investment for an individual school or district. To lessen the risk of purchasing the product and finding it isn't what

you want, a demonstration disk of the package can be purchased for \$6 which will be applied towards the purchase price of the package if you decide to buy it. But because of the comprehensive nature of the package it certainly seems that the students could greatly benefit by the inclusion of this kind of computer assisted instruction in a traditional math curriculum. The most salient feature of this package is its consistent quality—quality which could only have been achieved by fine educators who knew what they wanted, working in conjunction with gifted programmers who knew how to create it. □

"This hex program you sold me is a GYP! I can't hex a bleeping person with it."

"Simply the best word processor...anywhere"

For the Apple™

No hardware additions needed — What you see is what you get. All functions are displayed on the screen exactly as they appear in print including:

- Underlining
- Bold
- Superscript
- Even/normal justification
- Lower and upper case
- Block movement
- Global replace
- Plus many more features

CIRCLE 262 ON READER SERVICE CARD

Introducing Spinnaker. We make learning fun.

At Spinnaker Software, we make educational games that are actually fun.

Because they're fun, your children will use them. Instead of letting them collect dust in the basement.

And because your children use them, they'll be learning. And after all, isn't that what educational games are all about?

Our games are educational, because you can't kid parents.

As a parent, you're probably very concerned with how much time your kids spend playing mindless video games.

Sure, they're fun. But they don't do much more than develop reflexes and hand-eye coordination. Spinnaker games are different.

All our games have true educational value. They help develop a child's learning skills. And that's something your kids can take with them wherever they go.

Our games are fun, because you can't kid kids.

Kids like Spinnaker games for the same reasons they like roller coasters, going to the beach and ice cream sundaes.

They're fun. Lots of fun. So much fun your kids will probably forget they're learning.

Our games make the computer screen come to life. With colorful graphics, animation and sound.

And they're easy to use. In fact, a lot of our games are easy enough for kids who've never even used a computer before.

How do we make our games both educational and fun?

We're glad you asked.

Educators and game programmers write our software.

Educators, because they've been in the classroom and know how children

learn. And what it takes to keep their interest.

Game programmers, because they know how to have fun with computers. These programmers give our games the high resolution graphics, animation and sound that make them so entertaining.

And right now, we're introducing four new games that can be played on the most popular computers, Apple,[®] Atari,[®] and IBM.[®]

First, there's FACEMAKER. It's for young computer users, kids ages 4-8. FACEMAKER helps children improve memory and concentration and provides familiarity with the computer.

Another game for young users is STORY MACHINE. This game lets children ages 5-9 write their own stories and see them acted out on the screen. STORY MACHINE helps children learn to write correctly and acquaints them with the keyboard. Our SNOOPER TROOPS[™]

detective series gives your child mysteries to solve. As a Snooper Trooper, your child will have to do some daring detective work, including crawling through dark houses and talking to mysterious agents.

Designed for kids ages 10 and older, SNOOPER TROOPS helps children learn to take notes, draw maps, classify information, and develops vocabulary and reasoning skills.

All four games are available in stores today.

With Spinnaker products, you can rest easy knowing your children are spending their time wisely.

So ask your retailer about the growing line of Spinnaker games.

Because one of the smartest things parents can do is help their children learn.

SPINNAKER[™]
We make learning fun.

The promotional material for *Factoring Whole Numbers* states: "These are highly interactive programs that your students will enjoy. Each lasts about 20-30 minutes depending on student responses. Pacing to suit the individual 'talking' to the computer is built into the programs so that the student succeeds as learning occurs. The Series is appropriate as new material for students in the upper elementary and junior high schools, and for review or remedial work at the secondary or junior college level."

I have the Apple Version 2.0 programs

James S. Coan, RD #1, Box 149, New Hope, PA 18938.

for 16-sector 3.3 DOS. This comes on three diskettes, each of which contains four well designed factoring exercises.

Documentation

The software comes in a nice three ring notebook. The diskettes are in plastic jackets at the back. You get a title page, a single CPU software license, and five pages devoted to the teaching material itself. Non-profit educational institutions may purchase permission to make copies for additional CPUs. None of this material is required for the student. It is intended for the teacher.

However, there is no discussion of how to get the teaching material running on

- 6B Factoring Finale

the computer, nor is there any mention of how to terminate a session.

The Programs

The user soon learns that the display screen is set up for upper and lower case letters using the Apple hi-res graphics screen. The menu offers to run any of the programs on the current disk, and makes instructions optional. Each program has a nice leading hi-res display screen. Responses are ended by pressing Return. For word responses it is sufficient to enter the first letter only.

Figure 1 shows the contents of the three disks. Each A program introduces the topic and provides some practice. Each B program is designed to extend the concept and encourage the student to explore further. Most of the B programs finish up with a game or contest involving two or more students.

To quote the author: "Some of the B programs go beyond the standard junior high curriculum. These are designed to preview, in an informal fashion, ideas which will be important in later mathematical work." The material seems to do this very well.

Each lesson/exercise/game is designed to accommodate a wide range of skill levels within the topic being presented. Many of the instructions are optional. The display speed is user-controlled. Some of the games may involve up to six students.

The package is definitely user-friendly. All responses which one might expect are well fielded by the programs. Wrong answers are handled very well.

The analysis of responses is quite complete. It notices illegal decimal numbers,

numbers too high, numbers too low, and illegal negative numbers, and requests, "Number please" when all else fails. It even handles responses such as 1.4E1 when the correct response is 14. This is well done.

There is never a sarcastic word in this package. Right answers are treated with enthusiasm, while wrong answers are handled in a supportive way. The whole idea is to promote successful progress through the programs.

Often a program will offer to explain a concept. This provides the first time user a chance to get the maximum instruction, and allows the repeater to pass over unwanted detail.

Some of the programs ask questions designed to assess just how appropriate this lesson is for the student at the time. If the user's responses are reasonable, the lesson proceeds. If his responses are clearly out of line, the program suggests another lesson to be studied and returns to the menu.

All questions recognize Q as a request to select another program. Ctrl-C or Reset at any time also returns the user to the menu.

Each diskette may be run independently by either turning the Apple on with it in the disk drive or by typing in #S (slot). One can easily move from one

diskette to the next by placing the next one in the disk drive and issuing the Q request. There is no direct method offered for ending a session. The user is expected to turn the Apple off.

The optional instructions are well paced. The screen is presented a few lines at a time. Each screen is frozen in place with "Press return to continue" displayed on the bottom line.

I have selected a few sections to review here in detail.

Diskette One

Introduction: The introduction explains how to use the computer. The student is offered the option of all upper case or upper/lower case display. He can even control the time delay between sentences displayed on the screen. (It is assumed that the user has been able to put the disk in the drive and turn the machine on.)

1A Factor Pairs: Factoring a whole number into a factor pair is presented as finding the possible lengths and widths of a rectangle with a given area. It is recommended that you obtain 100 square floor tiles. Clearly you should get the little 1 inch by 1 inch ceramic ones. Alternatively you could cut cardboard squares. The student uses these squares to form rectangles and come up with areas and, later on, perimeters.

Diskette Two

3B The Sieve of Eratosthenes: This is an excellent treatment of the topic. The sieve is beautifully illustrated on the screen by actually crossing out all multiples of the most recently discovered prime. The student is asked for the first number to cross out and the computer does the rest. It is fun to watch.

In addition we learn when Eratosthenes lived and a little about Euclid as well. We learn about Twin Primes, Palindrome Primes, and even Goldbach's conjecture. (All even numbers can be written as the sum of two primes, one (1) may be used for this.) All in all, a math teacher's dream.

4A Exponents: This one very nicely teaches why exponents are useful by demonstration. If you properly factor 128, the program next asks if you want to try 16384. If you say "yes," the author is definitely up to the challenge. On the other hand, if the student repeatedly fails to get right answers, the program apologizes and returns to the menu. Clearly not threatening or intimidating at any level.

There is something in these programs for a wide range of students. Any teacher who has a computer which will support these programs and who teaches Factoring Whole Numbers will want to use them. □

RanaSystems

Your Apple computer can grow from ordinary to awesome in a matter of minutes.

The Elite disk drive Series by Rana Systems gives you that kind of magic. Quickly, easily and cost-effectively.

This superb family of sophisticated floppy drives was designed and perfected by a team of industry-respected engineers expressly for Apple® computer owners who have long been demanding more disk drive for their money.

Now they have a drive that makes an Apple perform the way it should. For example:

Elite One, the most economical Rana drive, delivers 15% more storage capacity than Apple's drive. The top-of-the-line Elite Three will provide an astonishing four-times more storage, approaching hard disk performance. It's done through exclusive high-density single and double-sided disks and heads.

More tips from the authors of *Beneath Apple DOS*...

Bag of Tricks™

By Don Worth and Pieter Lechner

Now there is more from the authors of the best selling book *Beneath Apple DOS*—four comprehensive utility programs on diskette and **over 100 more pages** of valuable information about the Apple II's disk operating system.

BAG OF TRICKS is useful to beginners and experienced programmers alike. It includes many "hand holding" tutorials that assist you in repairing damaged diskettes and allow you to change sector ordering, reconstruct blown catalogs, etc. etc. At the low price of \$39.95, BAG OF TRICKS is one of the best software values ever.

The four programs and their functions are:

1. TRAX dumps and examines a raw track, either 13-sector or 16-sector, displays the internal Apple diskette formatting information, and flags exceptions to standard formats.
2. INIT will reformat one or more tracks, attempting to preserve the contents of undamaged sectors. It also allows you to change sector order. This can cut disk access times by 40% or more!
3. ZAP is a sector editor like no other! More than 50 commands are available to assist you to locate, compare, change, or print the data on your diskettes. ZAP is even programmable! Using powerful macros, it is possible to transfer and compare DOS, CP/M, or PASCAL files.
4. FIXCAT automates the process of repairing a damaged diskette catalog. It operates with or without user intervention, locating "lost" files and rebuilding the catalog—from scratch if necessary! DOS removal and VTOC repair are also possible.

Requires Apple II or Apple II Plus with 48K RAM and one disk drive

Quiz Time in The Classroom

Spelling Bee from Edu-Ware is a well organized spelling package for kindergarten through third grade students. It was thoughtfully designed by people who seem aware of the problems inherent in a computerized spelling tutorial for classroom use.

I was particularly impressed with both the ease with which the teacher can become involved without any prior computer experience and the flexibility of the program in the area of setting parameters tailored to the individual student.

Spelling Bee consists of several different "modes" plus eleven units of spelling words (each accompanied by a line drawing). Three of these spelling unit categories are: "Simple 2 and 3 letter words," "Hard c's and silent e's," and "One syllable with Diphthongs" (which is really spelled "Diphthongs" and which just goes to show that even people who write spelling programs never outgrow the need for good spelling skills). In the Demonstration Mode the teacher may choose one of the spelling units and preview it.

The Learning Management Mode permits the teacher to enter the student's name, the spelling unit(s) on which he is to be tested, and the number of words to be chosen from each unit. This last feature is a very nice option in that it allows the teacher to take the child's attention span into consideration when setting up a test situation.

The Tutorial Mode gives the student an opportunity to practice spelling each of the words in the unit (after having seen them flashed briefly one at a time) without having his errors accepted by the computer or displayed on the screen.

Annie Fox, 35 Aries Lane, Novato, CA 94947.

Annie Fox

Drill Mode

The Drill Mode is the electronic equivalent to the old Friday morning "Class, are you ready for this week's spelling test?" With the parameters previously set in the Learning Management Mode the teacher has designed a test for a student based on his individual needs.

creative computing SOFTWARE PROFILE

Name: Spelling Bee

Type: CAI

System: 48K Apple II, DOS 3.3

Format: Disk

Language: Applesoft Basic

Summary: Cute

Price: \$39.95

Manufacturer:

Edu-ware
28035 Dorothy Dr. #200
P.O. Box 2222
Agoura, CA 91301

If Jennifer needs practice with her diphthongs (which are, by the way, complex vowel sounds made by gliding continuously from the position for one vowel to that of another all within the same syllable, e.g., chain, boat, toy), that's just what she will get.

After the Drill Mode is completed the student's score is recorded and reviewed

at the teacher's convenience. Since the computer keeps track of precisely which words were and were not spelled correctly the teacher is in a good position to pinpoint potential spelling problems and provide remediation.

Positive reinforcement is certainly a necessary element of the learning process. In this program, the reinforcer for a correctly spelled word takes the form of a point placed underneath a smiling face and a few bars from a familiar children's song. Although this is a nice touch, the graphics could have been a bit more spectacular.

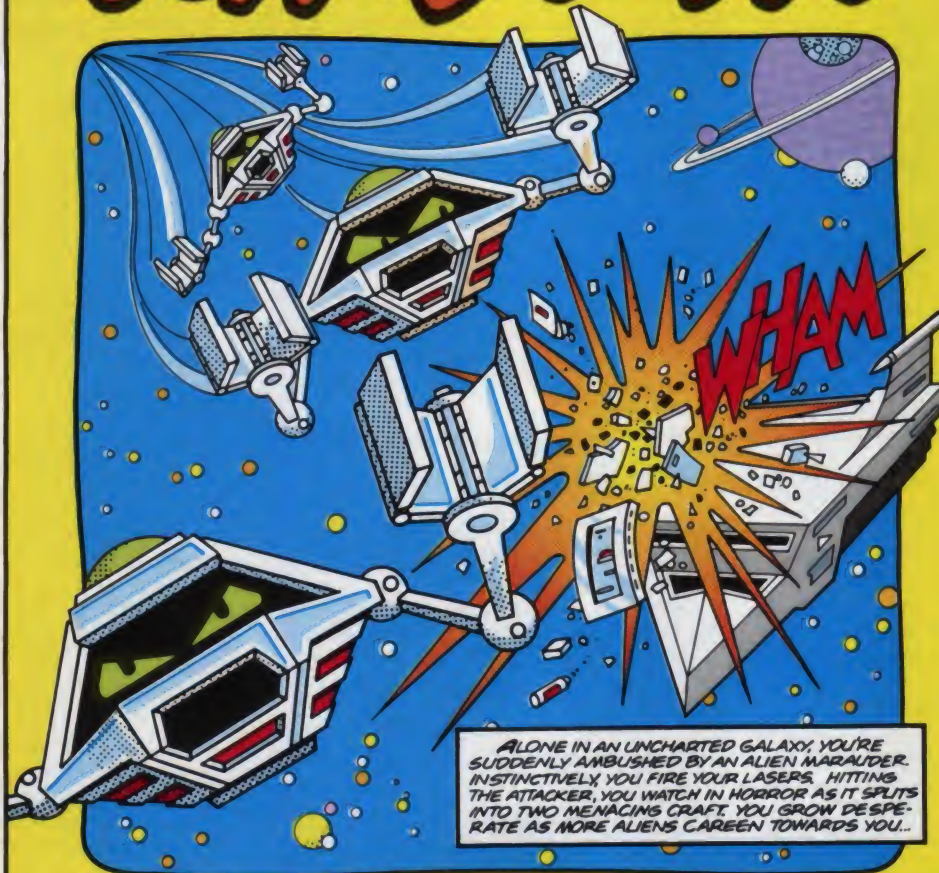

As was mentioned before, in addition to the spelling words which are provided for the student, *Spelling Bee* also displays a drawing paired with each word. The pictures were included in adherence to the sound premise that learning takes place as the learner makes the transition through concrete concept (picture) to abstract, symbolic representation, (written word). Let's talk about these drawings for a moment.

I am one educator who heartily approves of the introduction of fun into learning, and trying to identify computer drawn pictures is fun. Some of the pictures, however, are difficult to decipher.

If the word to be spelled is determined by the student's ability to identify the corresponding picture, there could be problems. For example, the "oval" in the program could easily have been a drawing of an egg. (Which is what several of my young friends guessed it to be.) Likewise, one morbid individual thought the "swing" was a scaffold, and another was sure it was "two chicken feet."

I mention this not to nit-pick but to point out that this kind of ambiguity

ambushTM

by Peter Fokos

You haven't lived until you've died in space.

And here's your chance.

Software author Peter Fokos has created Alien Ambush, a space age nightmare. This hi-res, full-color arcade game is written completely in assembly language to give those nasty aliens every advantage.

So if you have access to a 48K Apple* with DOS 3.3, and you're hot for some new thrills, Alien Ambush was written for you. But be warned: It just got a lot tougher to survive in space.

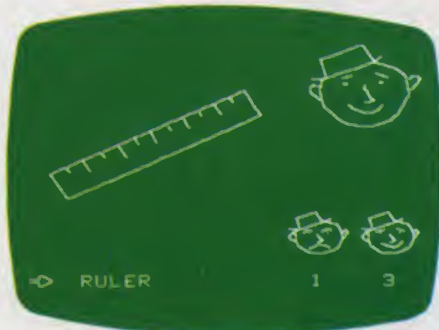

Available at finer computer stores everywhere. *Apple is a trademark of Apple Computer, Inc.

CIRCLE 206 ON READER SERVICE CARD

Quiz Time, continued...

provides built-in frustration for the young child. After all, how can he spell a word correctly, if he doesn't know what word he is supposed to be spelling?

Two of the spelling units in the Demonstration Mode Menu were labeled "Multisyllable words." I guess strictly speaking, "multi" means more than one, but of all the "Multisyllable" offerings only one (butterfly) had *more* than two syllables, and one of the words (stairs) had only

Spelling Bee.

one. (I'm sorry, but no amount of facial contortions allows me to get more than one syllable out of that word without

sounding like a throwback from the Beverly Hillbillies.)

Also, for some reason "magnet" and "pliers" are found in the unit called "Simple multisyllable words," while "apple" and "table" are considered "Complex multisyllable words." These are minor points and in no way devalue the program as a whole.

Documentation

Although the documentation for *Spelling Bee* was complete, it was contradictory in places and rather confusing in the sections describing how to enter the Learning Management Mode. I talked to the people at Edu-Ware and was advised that all of their documentation "is being rewritten to be easier to understand for the customer."

Spelling Bee is not a perfect product. If there were some way for the teacher to add words and pictures to the existing spelling lists in the program it would be improved markedly. It is, however, definitely a good spelling package for the money and any school which is lucky enough to have a computer would do well to include this program in its educational software library.

Math Competency Series

This program also goes a long way in permitting the teacher to vary the parameters of each of the math games. Since students are people and people are individuals it makes sense to be able to alter programs to fit the individual. Specifically the *Zeitgeist* package allows modification of Student's Required Response Time, Problem Type and Problem Difficulty, Duration of Game and Help Messages.

To make the practice of mathematical skills more inviting, the *Zeitgeist* people have attempted to appeal to the game player who dwells within every student. (Certainly a good idea, and bound to be more entertaining than flash cards.) In keeping with "the spirit of the times" they chose to model their programs after the hottest computer game genre: Space Games.

Before we delve into the specifics of these games, it should be noted that the descriptions given below do not match the visual display of the actual game, by any measure. Any child reading his student guide and preparing for a Star Wars-like space adventure is in for a cosmic disappointment.

According to my dictionary *Zeitgeist* means "spirit of the age, trend of thought and feeling." Perhaps the company's founders felt that they would christen their enterprise with a name which would describe their reason for existence, which, according to the cover of their documen-

tation involves "creating a better world in which to learn" (using computers, I assume).

The four programs in the *Zeitgeist Math Competency Series* are designed

creative computing SOFTWARE PROFILE

Name: Math Competency Series

Type: CAI

System: 48K Apple II, Applesoft in ROM, DOS 3.2 or 3.3

Format: Disk

Language: Applesoft Basic

Summary: An average CAI math program

49.50 single disk price

Manufacturer:

Zeitgeist
5150 North 6th St. #179
Fresno, CA 93710

for "drill, practice and enrichment." The intended audience is elementary and junior high school students, although the programs could certainly be used successfully for high school students or adults in need of math remediation.

These programs do not really *teach* mathematical concepts at all, and this

should be clearly understood by anyone who is contemplating using them for this purpose. A child who does not understand the concept of addition is not going to succeed in solving " $12 + 12 = ?$ " despite the presence of colorful space maps.

Math concepts are learned from discovery, manipulation of materials, visual demonstrations and determined teachers who are willing to try any and all combinations of the above until concepts become clear. Computer math programs are available in that they serve the function of *reinforcing* concepts and skills which the student already possesses.

Documentation

The documentation for the series is beautifully printed, complete and well organized for easy reference. The textured paper adds a touch of class. The student guide is excellent as it provides the learner with everything he needs to know about using the program (from turning on the TV to loading the diskette and rebooting if necessary). The inclusion of this kind of clearly written student instruction is rare among educational software packages, and yet what could be wiser?

Educational computer programs are, for the most part, designed for independent student use. If students don't know how to operate computers, they miss the opportunity to work on their own and teachers become overburdened. The more self-sufficient the student at the computer can be, the easier the use of computer-based instruction in terms of classroom logistics.

Another positive aspect of the *Zeitgeist* package is the Help Messages which accompany each of the games. These were written for the student to assist him in solving the type of problems with which he is currently working. They are composed of step-by-step procedures for the solution of certain math problems and the student must be able to generalize the rule to apply it to the specific problem with which he is having trouble. These Help Messages would serve well the student who simply needs to be reminded of a specific "how-to" portion of solving a problem. The student who is feeling confused and utterly lost probably needs more help than the Help Messages can offer.

Invader Round Up

The first game in this series is called *Invader Round Up*. Here the student must collect a certain number of invaders who have had the misfortune of wandering into a guarded quadrant.

Problems involving addition and subtraction of whole numbers must be solved before invaders can be located and captured. The computer supplies problems

valFORTH™ for Atari® 400/800
Professional Software for the Hobbyist

VALPAR INTERNATIONAL

FORTH has been used for years by ATARI® and others in programming their arcade games. FORTH is *fast*, 15-20 times faster than BASIC, and can make use of every capability for your computer. And it's no longer the province of the professional programmer! With valFORTH and the additional packages described below, you can create programs in an afternoon that would previously have taken weeks of hard work!

WHAT? YOU DON'T ALREADY KNOW FORTH?

Then take advantage of our special offer on *Starting Forth* by Leo Brodie. Widely acclaimed as the best book available on the subject, this entertaining treatment of Forth will make you comfortable with this exciting language quickly and easily. When you order *Starting Forth*, you get a free copy of our "Notes for the valFORTH User," including references, by page, to *Starting Forth*.

These are the exact utilities developed by Valpar International's professional software specialists and used to create our commercial software products.

NEW! By Popular Demand!

valDOS. Now you can use your valFORTH system to read and write normal Atari DOS Files created with valDOS or other sources. Also includes valDOS File Editor for creating and reading FORTH Source Code without "screens." (Not a general file editor.)

(Over 25 pages of documentation. Requires valFORTH.)

valFORTH™

Package contains: fig-FORTH kernel with mathematical and stack operations machine-coded for higher speed than normal fig-FORTH; line editor AND screen editor, debugger, sound and graphics commands, floating point, advanced 6502 assembler, diskcopiers, and much more! (Over 110 pages of documentation)

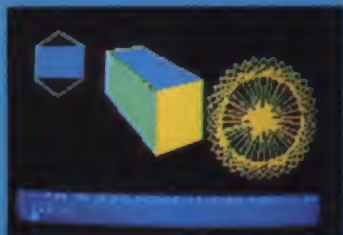

GENERAL UTILITIES AND VIDEO EDITOR

Utilities: 4 array types, 4 case types, text on graphics 8, extensive string manipulation and keyboard input, STICK & PADDLE, randoms, bit manipulation, and much, much more

Editor: *fast, powerful, complete* valFORTH screen editor 1.1. A professional-quality tool that makes editing a pleasure.

(Over 60 pages of documentation. Requires valFORTH.)

PLAYER-MISSILE GRAPHICS, CHARACTER EDITOR, & SOUND EDITOR

Player-Missile: Create, move, color, change images of and bound players and missiles with high level commands. Full support of 5th player, multicolor players, etc. etc. All critical sections in machine code

Character Editor: Compose character sets with joystick. Simultaneous display of created characters. Make images for players and missiles.

Sound Editor: Simple independent control of all four voices (one joystick per voice) and audio-control register. Create any single-setting sound with graphical and tabular readout.

(Over 35 pages of documentation. Requires valFORTH.)

VALPAR INTERNATIONAL
3801 E. 34TH STREET
TUCSON, ARIZONA 85713

Call Toll-Free 800-528-7070 In Arizona call (602) 790-7141

Principal Software Authors: Stephen Maguire and Evan Rosen

Coming Attractions: Next month

TARGET COMPILER
3D WORLD

DISPLAY FORMATTER

Fast, simple creation of all types of display lists, with automatic 4K boundary jumping. Automatic or user controlled memory allocation, and formatting for horizontal and vertical scrolling, and display list interrupts. (Over 30 pages of documentation. Requires valFORTH.)

TURTLE & valGRAPHICS, AND ADVANCED FLOATING POINT ROUTINES

Turtle Graphics as in Atari® Pilot and much more: ○

All graphics modes supported — even GTIA and "7+" Draw and fill commands *faster* and *smarter* than Basic. "Turn-toward" for "chasing" and vanishing point effects: point labeling, etc. Also SIN, COS, ATN, ATN2, etc. added to floating point

(Over 35 pages of documentation. Requires valFORTH.)

Text Compression and Auto Text Formatting

A unique, two-part utility!

- Text Compression allows the packing of text into much less space than normally required. Useful for wordy Adventure games, "artificial intelligence," etc.!
- Auto Text Formatting takes both normal and compressed text and routes it to the video screen "windows."

(Over 20 pages of documentation. Requires valFORTH.)

valFORTH alone requires 24K
valFORTH plus one or more packages requires 32K minimum
Memory requirements include 10-12K working space
All products are now on non-protected disks.
Over 270 pages of detailed documentation!

valFORTH	\$45.00
General Utilities and Video Editor	40.00
Player Missile Graphics, Character Editor, and Sound Editor	40.00

CIRCLE 296 ON READER SERVICE CARD

Quiz Time, continued...

and checks answers. The correct answer causes a laser beam to zap the invader off the screen (the instructions say he is being kept in a holding area for relocation). Miss the problem and the invader escapes. When all of the invaders have been captured, the screen displays a space transport that zooms off into nothingness, presumably carrying all of the aliens to a distant galaxy.

Space Scanner

Next we have Space Scanner in which the student is a navigator during an impending alien attack. In order to determine the correct intercept on a Battle Map the student must successfully multiply or divide whole numbers which are called warp and vector values. If the answer to the problem is correct, the enemy ship is destroyed.

After five correct answers the enemy battle star is attacked and demolished. If the intercept is not correct, however, the enemy fighter will fire at the student's ship and inflict 20% damage to the shields. Five wrong answers and that's the end of that interstellar vessel.

In the final two games of this package the student is rewarded with a game

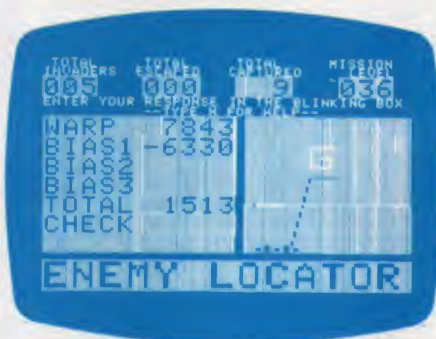

within a game. That is, when the math problems are successfully completed, he can use the computer keyboard to control objects on the screen in a similar manner to video arcade games.

Invader Attack

Game number three is Invader Attack in which the student commands a damaged star cruiser with an inoperative photon engine. The student must regulate

subtraction of fractions. When a problem is solved correctly the cruiser advances toward the star base. When one is missed, an encroaching enemy ship menaces forward.

The game is won by reaching the star base. If the student gets to the star base first, all is saved and a primitive video shoot-out commences. If the enemy arrives at the star base first it's all over for the good guys.

Math Competency.

the amount of fuel force by solving math problems which involve the addition or

Space Mouse

The final game of the series is Space Mouse, the only one that does not involve defending oneself against attacking aliens. Instead, the student takes on the role of a space biologist trying to catch a rare space mouse, presumably for the purpose of observation and study.

The mouse trap is baited with molten cheese when the student successfully solves multiplication and division of fraction problems. When the mouse is caught the student is rewarded with a chance to race him through a maze, which is nerve-racking but fun.

Playing space-oriented math games would probably serve as a high motivator only for a majority of male students. My four years of experience with thousands of students in free choice computer games situations leads me to the very definite conclusion that most girls do not care one ion about space games. So for girls (who might not be crazy about math to begin with), something needs to be created that would appeal to them as well.

The choice of space games might be a poor one for another reason. If Fried Chicken Supreme serves undeniably the best chicken in the world do you sell chicken when you open your new specialty restaurant next door? Only if you're incredibly naive (or maybe not too bright). Educational games manufacturers have some competition from video games that is tough to beat. If the competition is creating incomparable space games then the educational software people might be wise to create anything *but* space games.

Let's face it, drill and practice of any skill can be pure drudgery. Spending time with the *Zeitgeist Math Competency Series* is much more fun than flipping through a stack of flash cards. On the other hand, there must be a more creative way to involve students in the practice of math skills than what I presented here.

In spite of the superb documentation and clever game ideas, this package does not succeed because the execution of these ideas leaves much to be desired. If a programmer with superior skills in computer animation had tackled these games, the result would have been praise-worthy and priceworthy. □

ALF COPY SERVICE

FAST • RELIABLE • LOW COST

If you need your software duplicated quickly and conveniently, ALF's disk copying service is the answer. Most orders are shipped in less than a week. Every disk we copy is verified bit by bit and guaranteed 100% flawless. Standard formats include Atari, Apple (including nibble-copy-proof and double-boot formats), and TRS-80 model 1.

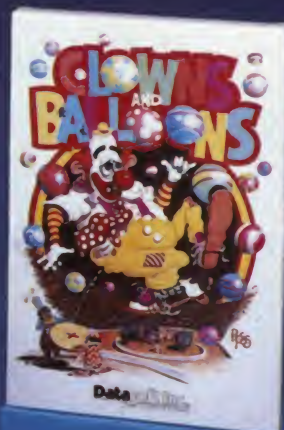

Our "no frills" pricing means you don't have to buy extras you don't need. Of course, we have the frills too — including custom printing and packaging. Call us today for complete details.

A Symbolic Mathematics System

David D. Shochat

creative computing

SOFTWARE PROFILE

Name: muSimp/muMath-80

Type: Symbolic mathematics programs

System: CP/M, Apple, TRS-80 48K

Format: Disk

Language: Machine

Summary: "Lisp-like" math language

Price: \$250

Manufacturer:

Microsoft
10700 Northup Way
Bellevue, WA 98004

The following is a revision of a review of muSIMP/muMATH-79 which originally appeared in SIGPC Notes vol. 4, no. 1/2.

About 20 years ago, I had the opportunity to see a real computer, an IBM 709. When I asked whether it could do calculus, I was told that a digital computer could do numerical differentiation and integration, but that symbolic manipulation of the function definition was inherently outside the domain of the computer.

The muMath software package, developed by Albert D. Rich and David Stoutemyer of the Soft Warehouse and available through Microsoft for 8080/Z-80 disk systems (and now

Apple II as well), can do a surprising amount of calculus—symbolically, the way you learn to do it in a calculus class. For example, *muMath* can integrate

$$(1 + X^2)^{(1/2)}$$

in about seven seconds (on my 2 MHz Z-80 CP/M system). *muMath* can also do exact rational arithmetic, with (up to) 254-byte integers in any number base to 36, a great deal of algebra, some symbolic trig and even matrix algebra: *muMath* will find the inverse of

$$\begin{matrix} \{[1, 2], & \text{or of} & \{[a, b], \\ [3, 4]\} & & [c, d]\} \end{matrix}$$

Getting all of this to work on a microcomputer with only 64K (or less) is impressive, to say the least. The secret is modular construction. You load only part of *muMath* at a time. It is unlikely, for example, that you will need to do matrix inversion and integration at the same time. The precious memory resources must be used as efficiently as possible, a fact which reflected in the ritual of building and saving the system.

To get started, execute MUSIMP.COM. The muSimp interpreter is loaded in, a sign on message is printed, and the muSIMP "?" prompt appears.

muSimp is the Lisp "surface language" in which *muMath* is written. You may respond to the prompt in several ways.

1. You may make an assignment:

S: 13; (cr)

muSimp's response here would be:

@: 13
?

2. You may use an existing function:

D: S * 4; (cr)

@: 52
?

David D. Shochat, Dept. of Mathematics, Santa Monica College, 1910 Dico Blvd., Santa Monica, CA 90405.

STAR MAZE

Star Maze, a tour-de-force of hi-res animation and graphics. Yours is a desperate mission—to find and recover the power jewels hidden in the maze before your fuel runs out.

Star Maze features animation effects never seen before on an Apple as well as the fine touches that mark it as a Sir-tech game.

- huge 18 color multi-directional maze
- 16 maze levels
- playable by keyboard, paddles, joystick or joyport
- high scores saved to disk
- and more . . . all for \$34.95

*Programmed by Gordon Eastman from an original design

muMath, continued...

3. You may define a new function. (Every line of user input is terminated with a carriage return):

```
FUNCTION COMBS (N, K),  
  WHEN K = 0, 1 EXIT,  
  N * COMBS (N-1, K-1) / K  
ENDFUN $  
? COMBS (D, 5);  
@: 2598960  
?
```

The definition of COMBS, which computes the number of combinations of N things K at a time, shows that recursion is allowed.

```
LISTEXAMPLE: ((1 ONE) (2 TWO)  
  (3 THREE)) &  
@: ((1 ONE) (2 TWO) (3 THREE))  
? FIRST (LISTEXAMPLE) &  
@: (1 ONE)  
? REST (LISTEXAMPLE) &  
@: ((2 TWO) (3 THREE))  
? REST (FIRST (LISTEXAMPLE)) &  
@: (ONE)  
? REST (REST (FIRST (LISTEXAMPLE))) &  
@: FALSE  
(the name FALSE is equivalent to the empty list)  
? FUNCTION MAPFIRST (LIS),  
  WHEN EMPTY (LIS), FALSE EXIT,  
  ADJOIN (FIRST (FIRST (LIS)),  
    MAPFIRST (REST (LIS)))  
ENDFUN $  
? MAPFIRST (LISTEXAMPLE) &  
@: (1 2 3)
```

The use of the "&" as a termination symbol instead of ";" indicates to the DRIVER function, which contains the main interaction loop, that the result of the computation should be printed as a list, rather than as a mathematical expression in standard mathematical notation. A "\$" means the result should not be printed at all.

```
EXPRESSION: X + Y $  
? EXPRESSION ;  
@: X + Y  
? EXPRESSION &  
@: (+ X Y)
```

Internally, only the latter (list) form really exists. But this is almost totally transparent to the user. The DRIVER function mentioned above gets its input through a function called PARSE, which normally expects all of its input to be in non-list notation. It is this PARSE function that really defines the difference between muSimp and normal Lisp.

For example, if PARSE sees FUNCTION in the input stream, it translates everything from there to the next occurrence of ENDFUN into a list, which is essentially the Lisp equivalent of that function definition.

In Lisp, everything is a list, including function definitions.

In muSimp, PARSE translates both standard mathematical notation, and MuSimp syntax itself into list/Lisp form. So the difference between muSimp and normal Lisp exists only "at the surface."

When PARSE sees a single quotation mark, two things happen. First, it reads what follows in normal list notation. Second, it adds the QUOTE function name onto the expression, which causes the expression to be "taken literally," rather than being evaluated. Thus in the definition of LISTEXAMPLE above, even if we had previously made an assignment

```
ONE: UNO $ ,
```

LISTEXAMPLE would still contain only ONE, rather UNO.

Once a function definition has been made, it becomes a part of the system, which can then be called upon by other function definitions. And that's how you bring *muMath* into the picture, because new function definitions (and other kinds of valid muSimp input), can be read in from disk as well as from the keyboard. For example, if you type:

```
RDS (ARITH, MUS);
```

with the source file ARITH.MUS on the disk in drive A, all the muSimp source code constituting ARITH.MUS will be read in and made a part of the system just as COMBS and MAPFIRST were. Now you can do:

```
1/2 + 1/3 ;  
@: 5 / 6
```

muMath is a collection of 15 muSimp source files, all but one of which depend on certain other source files being "in" at the same time. To do definite integrals, for example, you must load in five of these source files.

Any time you want you can save the state of the system on disk including (in internal form) all the muSimp code read in so far, just by typing

```
SAVE (<name>) $
```

(with a disk with enough free space in drive A), where <name> can be any available primary file name for your DOS. muSimp will create a special memory image file with primary name <name> and secondary name SYS. Then you can come back any time and just by typing (while in muSimp):

```
LOAD (<name>) $ ,
```

you will be right back where you were just before the SAVE. Or, another way to do it is to type:

```
MUSIMP <name>
```

as a DOS command, in which case muSimp will LOAD <name>.SYS for you before entering the DRIVER loop.

The package comes with ten other source files which are 90% comments. These are the lesson files, which are so well-written they make the process of learning to use the system a great deal of fun. The lesson files are read in like any muSimp source file, but they are echoed at the console and consist mostly of comments, delimited by matching percent signs. Every once in a while, the lesson gives you an exercise to do, ends the comment with a "%", and then makes the assignment:

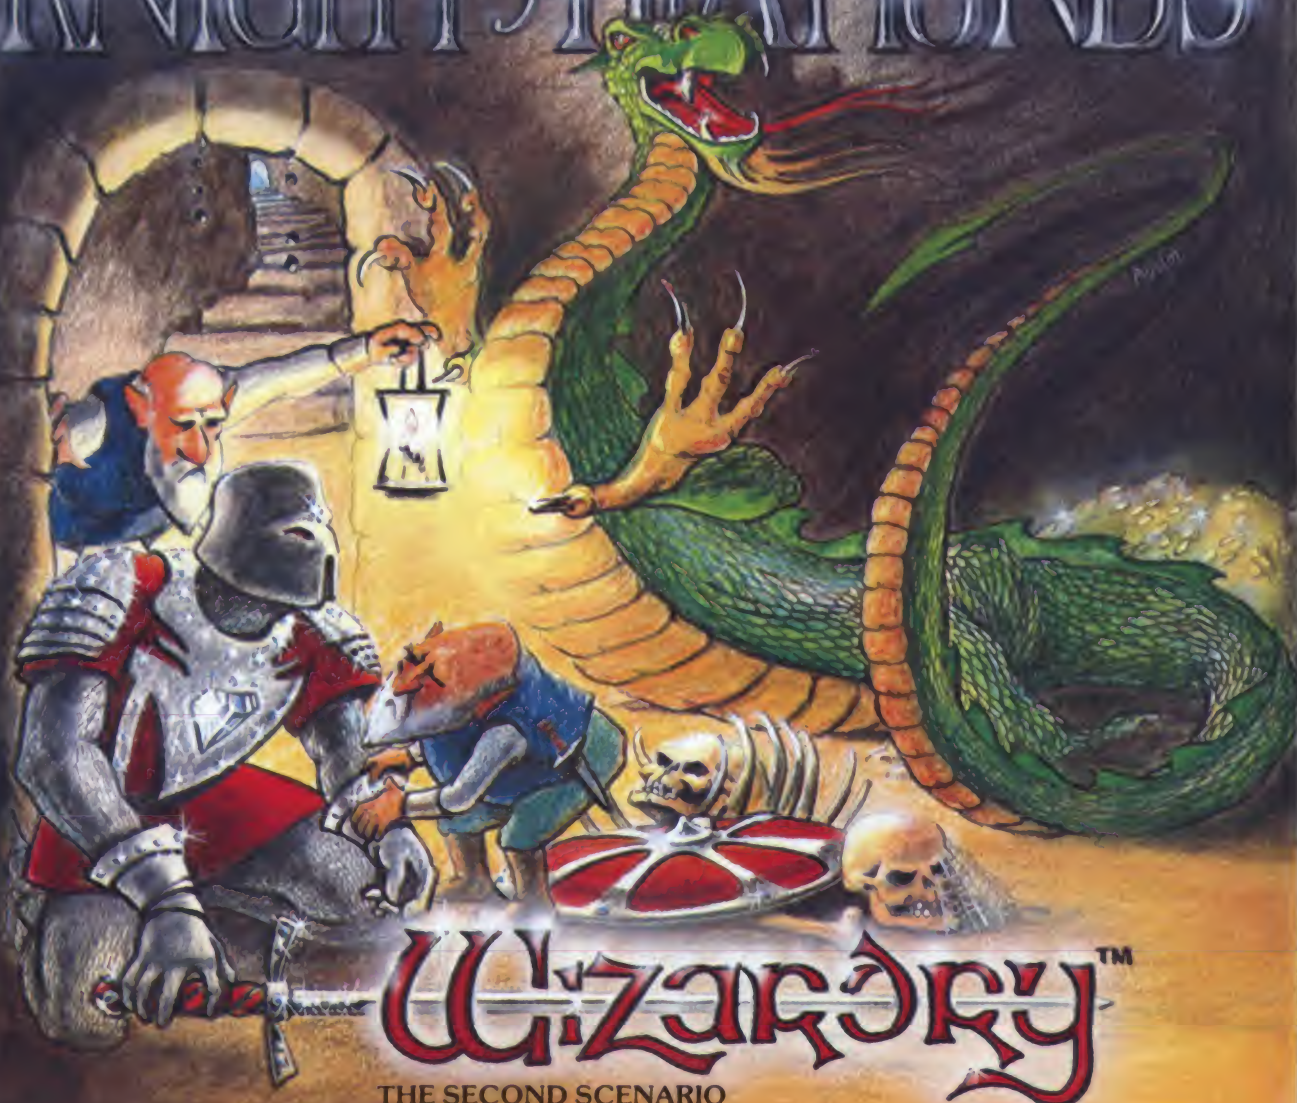

```
RDS: FALSE $
```

That stops the input from the disk and gives you control of the system to do your exercise. When you're done, you type:

```
RDS: TRUE $
```

and the lesson takes over again. The lesson may also stop being a comment long enough to do an example, providing actual muSimp source to the system. This example may, in turn, depend upon function definitions which you added to the system while doing a previous exercise.

KNIGHT OF DIAMONDS

Wizardry™ THE SECOND SCENARIO

The Wizardry Adventure Continues! Barbarians return en masse to sack the city of Llylgamyn. News of the terrible state of Gnida has been reclaimed by an evil lord. A hero has travelled fast. Protected for a thousand years by the power of the wondrous artifact, and now defenseless, Llylgamyn is doomed, unless you turn!

What have people said about the first scenario?

[Wizardry] has the potential to become a classic.

David Lubar, Creative Computing

The most eagerly awaited adventure

Computer Merchandising

perhaps the most advanced adventure program on the market.

Forest Johnson, The Space Gamer

The amount of detail is fantastic.

Neil Shapiro, Popular Mechanics

Knight of Diamonds, a challenging scenario for experienced Wizardry players (13th level characters will barely survive!).

Proving Grounds of the Mad Overlord (shown at right) and Knight of Diamonds operate on any Apple Computer* with at least 48K, DOS 3.3, and 1 disk drive.

Proving Grounds of the Mad Overlord—\$49.95

Knight of Diamonds—\$34.95

Join over ten thousand adventurers exploring the ultimate fantasy experience.

Wizard-SOB™

SERIAL OUTPUT BUFFER CARD

Input a new task while your old task prints out

NO MORE DELAY FOR SLOW PRINTERS

WIZARD-SOB is a serial printer interface that lets you operate your Apple while data from your previous operation is printing out. It ends waiting while your printer prints. The WIZARD-SOB contains a 16K byte "character buffer" that may be expanded to 32K bytes of character buffering. It accepts data at the Apple's rapid transfer rate, stores the data and feeds it to your printer at the rate the printer can accept.

- Fully compatible with all Apple II and Apple II Plus* computers
- Fully compatible with most

Apple software including Applesoft BASIC*, Integer BASIC*, CP/M, Pascal, etc.

- Fully compatible with most Apple II expansion boards
- Low power consumption for cool reliable operation
- Leads soldered directly into board for reliable operation
- Many formatting features
- Two-year factory replacement warranty
- RS-232 printer interface compatible

Backed by the world's #1 independent manufacturer of peripheral controllers

muMath, continued...

It all works beautifully as long as you don't try to stop in the middle of a lesson and save what you have done so far. It is possible, but tricky: you must refer to the printed copy of the lesson to see what "finishing up" operations it would have done, do them through the keyboard, and finally SAVE a memory image as usual. When you come back, you will still have to run through the lesson file from the beginning, but now you can skip the exercises you have already done.

Five of the lessons teach the use of those features introduced to the system by the ARITH and ALGEBRA files of *muMath*. After completing them, you can use the other *muMath* files without much difficulty, with the aid of the printed documentation.

The remaining five lessons teach the *muSimp* language — to a point. The trouble is, they are so beautifully written, you will feel somewhat lost when, after the fifth lesson, you must start learning from the printed documentation, which is much more terse than the lessons. The lessons really "take you by the hand"; the printed material works in a way which is actually similar to the way the system is structured internally: defining itself in terms of itself.

It was a frightening experience at first, trying to learn from the printed discussion of *muSimp*, but I finally got used to it. After a year and a half, I think I can appreciate the concise style.

The documentation has been improved considerably, since the original *muSimp-79* version, but there is still room for improvement. The function READ is not documented at all (probably an oversight).

Considerable information is included about the various property lists used by PARSE, but the definition of PARSE itself is missing—I had to dig out the internal (Lisp) form to see how it works. And it is only by seeing how PARSE works, that some of the documentation which is included becomes intelligible.

muMath can handle a wide variety of symbolic math problems, so whenever it fails to come up with an expected solution or simplification, it leaves you wondering why. The only way to find out *why* is to delve into the source files themselves and uncover the methods used by *muMath*. I've also found this to be one of the best ways to learn about important techniques which are not discussed in the lessons or in the printed documentation (such as storing function definitions on property lists).

Another interesting approach is simply to experiment with *muMath*. In the examples which follow, the symbol "→" will mean "simplifies to."

$$8^{1/2} \rightarrow 2^{3/2},$$

but

$$343^{1/2} \text{ doesn't simplify.}$$

This is because ARITH works with a very short list of primes: (2 3 5). If you reassign:

$$\text{PRIMES: } (2\ 3\ 5\ 7)\ \$$$

then,

$$343^{1/2} \rightarrow 7^{3/2}.$$

Some complex arithmetic is possible (# 1 is i):

$$(1 + \#1)^2 \rightarrow 2\#1,$$

but

$$(2\#1)^{1/2}$$

appears to be too much to ask, even with both trig files loaded.

With the LOG file loaded,

$$\text{LOG } (2^X, 2) \rightarrow X,$$

(the second argument is the base), and

LOG (8, 2) → 3

(an improvement in the latest version).

muMath forces the user to do a certain amount of crucial decision-making by setting what are called control variables. For example, if the control variable NUMNUM has the value 2,

$$2 * (X + 1) \rightarrow 2 + 2 * X,$$

and if NUMNUM is -2,

$$2 + 2 * X \rightarrow 2 * (1 + X).$$

If NUMNUM is 30,

$$(X + 2) * (X + 3) \rightarrow 6 + 5 * X + X^2,$$

but, and this is perhaps the biggest weakness of *muMath*; it cannot factor even a simple quadratic such as the one above. And yet, with the equation-solving files loaded,

$$\text{SOLVE } (X^2 + 5 * X + 6 = 0, X) \rightarrow$$

$$\{X = -2,$$

$$X = -3\},$$

even though the former task is easily reducible to the latter. The manufacturer says (in one of the lessons) that they are working on it for future releases.

You would expect:

$$X / (X * Y) \rightarrow 1 / Y,$$

but one day I couldn't seem to make it happen. I finally realized that the problem lay with the control variable EXBAS which needs must be a positive multiple of 2 in order for the cancellation to work. Now EXPBAS being a positive multiple of 2 is supposed to allow such things as:

$$(X * Y)^2 \rightarrow X^2 * Y^2.$$

In order to make sense out of all this you must realize that internally, a fraction A/B is equivalent to $A * B^{-1}$ (actually the list: $(* A (^ B - 1))$), so the $X * Y$ in the denominator of the cancellation example is really a factor of the form: $(X * Y)^{-1}$, which explains why the state of EXPBAS is so crucial, in a problem which seems to have nothing to do with exponents.

The control variable DENNUM must be a negative multiple of 15 in order to get:

$$1/X + 1/(X + 1) \rightarrow$$

$$(1 + 2 * X) / (X * (1 + X)).$$

but then DENDEN must be a positive multiple of 3 if you want the denominator multiplied out, and so it goes.

Guiding *muMath* through a tricky problem of adding rational expressions sometimes seems to take as much skill as doing the problem yourself. Of course, *muMath* is especially impressive with a really tedious problem such as $(1 + X)^{20}$ (PWREXP must be 2).

I have found the trig and calculus capabilities of *muMath* to be surprisingly good: *muMath* will differentiate just about any function you give it, since it knows all the standard rules. Integration is, of course, the real test.

$$\text{INT } (1/(X^2 + 5 * X + 6), X) \rightarrow$$

$$\text{LN } ((-4 - 2 * X) / (6 + 2 * X)),$$

which can be further simplified only by a subsequent re-evaluation of the answer, with NUMNUM and DENDEN set to -2. A careful study of the two integration source files reveals that the above problem is done by completing the square. Since *muMath* can't factor quadratics, there is no way it could do the problem by partial fractions. But it is clear, even without examining the source files, that *muMath* really doesn't know anything about partial fractions, since it can't integrate

$$1 / (X^3 + 1),$$

Wizard-BPO™

BUFFERED PRINTER OUTPUT

Allows new-task input while old-task prints out.

STOP WAITING FOR SLOW PRINTER OPERATION

WIZARD-BPO is a parallel printer interface that lets you use your Apple-while data from a previous operation is being printed. No more wasting of your precious time while your printer prints. The WIZARD-BPO contains a 16K byte "character buffer" that may be expanded to 32K bytes of character buffering. It accepts data at the Apple's rapid transfer rate, stores the data and feeds it to your printer at the rate the printer can accept it.

- Fully compatible with all Apple II and Apple II Plus* computers

- Fully compatible with most Apple II expansion boards
- Fully compatible with most Apple software including Applesoft BASIC*, Integer BASIC*, CP/M, Pascal, etc
- Low power consumption for cool reliable operation
- Leads soldered directly into board for reliable operation
- Many formatting features
- Two-year factory replacement Warranty

Backed by the world's #1 independent manufacturer of peripheral controllers

Available at all fine

NEW!

Kiss the 5 1/4" floppydisk goodbye!

Amdek has revolutionized data storage for personal computers with the new AMDISK-3 Micro-Floppydisk drive system. The system consists of 2 drives and a power supply, fully compatible with 5 1/4" floppy disk drives. The 3" disk is encased in hard plastic, protected from dust and fingerprints, and it's easy to mail.

Just write, or call to receive our data sheet on the new AMDISK-3 Micro-Floppydisk Cartridge system.

- 1 Megabyte (unformatted) storage capacity.
- Track-to-track compatible with 5 1/4" floppy-disk drives.
- 3" shirt-pocket sized disk cartridge.
- Drive has built-in power supply.

CIRCLE 106 ON READER SERVICE CARD

even if you do the factoring for it, *muMath* appears to be able to do integration by parts, successfully integrating such things as

$$X^2 * \#E^X$$

($\#E$ is e), but if you look at the source code, what you find is that *muMath* knows many of the special reduction formulas, which one normally derives using parts. Surprisingly, *muMath* can't integrate

$$X * (1 + X)^{(1/2)},$$

which is easy using parts.

The latest version of *muMath* (MuSimp/muMath-80) includes three source files which were not in the previous version: TAYLOR.DIF, LIM.DIF, and SIGMA.ALG.

The file TAYLOR.DIF, which consists of a single function definition, generates Taylor polynomials. For example,

$$\text{TAYLOR}(\text{TAN}(X), X, 0, 5) \rightarrow$$

$$X + X^3/3 + 2*X^5/15.$$

Expansions about points other than 0 are "multiplied out" whether you like it or not. This turns out to be inherent in the algorithm used, but one can easily define:

```
FUNCTION TAYLOR1 (EX, VAR, POINT,
ORDER),
```

```
EVSUB (TAYLOR (EVSUB (EX, VAR,
VAR+POINT), VAR, 0, ORDER), VAR,
VAR-POINT)
```

```
ENDFUN $
```

Now,

$$\text{TAYLOR1}(\text{LN}(X), X, 1, 5) \rightarrow$$

$$-1 + X - (-1+X)^2/2 + (-1+X)^3/3$$

$$-(-1+X)^4/4 + (-1+X)^5/5.$$

LIM.DIF, as its name suggests, calculates limits, using the differentiation machinery of *muMath*. For example:

$$\text{LIM}((X - \text{SIN}(X)) / X^3, X, 0) \rightarrow$$

$$1/6.$$

$$\text{LIM}((1 + 2*X)^{(3/X)}, X, 0) \rightarrow$$

$$\#E^6.$$

$$\text{LIM}(\text{LN}(X) / X, X, \text{PINF}) \rightarrow$$

$$\text{PZERO}.$$

In the first two examples, the limit is understood to be from the right (otherwise an additional argument to LIM must be used). The last example shows the use of PINF, to denote positive infinity, and PZERO, to indicate that the limit of 0 is approached through positive values. If we ask *muMath* to do a more general example, e.g.

$$\text{LIM}((1 + A*X)^{(B/X)}, X, 0);$$

a curious thing happens: *muMath* starts asking for additional information.

@:

??? A ???

ENTER SIGN (0 + -)?

A single character response of "+" is accepted and the computation immediately resumes, finally producing the expected answer,

$$+E^{(A*B)}.$$

As you would guess, the file SIGMA.ALG does summations (and products too). For example:

$$\text{SIGMA}(K^2, K, 1, 100) \rightarrow 338350$$

$$\text{SIGMA}(1/K^2, K, 1, 20) \rightarrow$$

$$17299975731542641 / 10838475198270720$$

In some cases, it can even handle a sum with a variable number of terms:

$$\text{SIGMA}(K^2, K, 1, N) \rightarrow$$

$$(1+N-3*(1+N)^2+2*(1+N)^3) / 6$$

$$\text{SIGMA}(1/2^K, K, 0, N-1) \rightarrow$$

$$(-2+2^{(1+N)}) / 2^N.$$

Incidentally, if you want the result in another form, you must re-evaluate the answer with appropriate flag settings. For example, the above result was obtained even with DENNUM = 3. But then,

$$\text{EVAL}(@) \rightarrow 2-2^{(1-N)}$$

(The atom @ is always bound to the result of the previous computation.) If LIM.DIF is loaded along with SIGMA.ALG, the prospect of infinite series arises. As far as I can tell, this is limited to geometric and telescoping series (we can't expect miracles). Also, its best *not* to have LIM.DIF loaded unless you need it, as it interferes in an odd way with the finite sum activity of SIGMA, e.g. asking (twice!) for the sign of $-\text{LN}(2)$ during the evaluation of a finite geometric series with common ratio $1/2$.

When I first started in with *muMath*, it was the symbolic math which fascinated me most. And it is indeed an amazing accomplishment, especially considering the limited memory space. Also, I understand that there are problems in physics and engineering which can be rendered tractable only by using a combination of numerical and symbolic methods.

I really don't know how useful *muMath* would be to a person who doesn't already know the relevant mathematics. I would love to see what would happen with *muMath* in the hands of my beginning algebra students, but I haven't yet had the opportunity. I really believe a person could learn some mathematics just by learning to use *muMath*, but this is only speculation.

What excites me most now is the muSimp language itself. Programming in muSimp involves using, in a very concrete way, the same techniques of inductive definition, building complex structures from simple ones, and then analyzing and operating on those structures inductively, that are fundamental to theoretical work in set theory and logic. It also turns out to be much more useful as a general purpose language than I originally suspected, particularly now that you can easily link muSimp to your own machine language routines.

muSimp is also an excellent bridge between "traditional" programming languages and Lisp. Based on my own experience, I think it would be very easy and natural for anyone accustomed to Pascal or PL/I to start right in with muSimp, but then when he subsequently (I would say inevitably) discovers Lisp, it will seem natural too. I feel, however, that any further discussion of the muSimp language should be conducted in the context of Lisp itself and Lisp surface languages generally.

The *muMath* package is certainly an impressive piece of work. Although I am particularly interested in its potential as a teaching tool, it will undoubtedly find uses in other areas as well. But at any rate, the time I have spent with *muMath* and muSimp has been challenging and a great deal of fun. \square

Writing Courseware on the TRS-80

R. Reed Hardy and Eliot S. Elfner

creative computing

SOFTWARE PROFILE

Name: TRS-80 MicroPilot

Type: Programming Language

System: TRS-80 Model I, III, 32K

Format: Disk

Language: Machine

Summary: Easy and direct route to custom C.A.I. software

Price: \$79.95

Manufacturer:

Radio Shack
1800 One Tandy Center
Ft. Worth, TX 76102

After using Radio Shack's *MicroPilot* (formerly known as *Pilot Plus*) to write about 5000 lines of tutorial software, we feel qualified to praise and criticize this version of *Pilot*.

Pilot has become the generic name for a programming language that is especially well suited for authoring and executing CAI educational programming. There are now several versions of *Pilot* in fairly

common use, each of which has its own strengths and weaknesses.

This review is not intended to be a complete comparison of *MicroPilot* with other versions of *Pilot*. It is simply a description of the authors' experience with *MicroPilot*.

Let me begin by praising Radio Shack for their initiative in developing *MicroPilot* and thanking them for allowing us to use a pre-publication version so that we could begin authoring programs at least six months earlier than would otherwise have been possible.

Strengths

The strengths of *MicroPilot* lie in its efficiency for educational/interactive programming. With *MicroPilot* you can ask a question, get an answer, evaluate the answer and appropriate feedback with three or four simple commands. You can keep track of a student's progress so that you can automatically start him where he left off when he logs onto the system. All of these characteristics are common to most forms of *Pilot*.

The features that make *MicroPilot* shine are its edit/run capability, its graphics, its sound generation capability, and its record keeping commands.

There is also a graphics screen generation utility (Graphics/QLT) that allows the user to "draw" a screen and store it on disk for use in programs. These screens are developed during both programming and execution, much more quickly than screens developed using graphics commands in most cases. (Note: this utility

will not run on machines without lower case capability.) This screen generation utility can also be used to allow the student to "draw" a screen which can then be saved for later evaluation or simply dumped.

Another *MicroPilot* strength is the editor that is included with the software. The editor is essentially the same as that used for Level II Basic which makes it very convenient for those who are accustomed to using Radio Shack Basic.

During program authoring, *MicroPilot* allows the author to run a program starting with any specified line number, execute any valid *MicroPilot* command directly, break into a program and then re-enter the program where it was interrupted by typing "continue." Lines and characters can be edited with ease.

There are other strengths that those who aren't familiar with other versions of *Pilot* may not appreciate. For example, there are commands to clear the screen and home the cursor (N:), delay program execution for any specified number of seconds (D:N), pause until a key is pressed (W:), and print text on the printer instead of the screen (P:).

These are functions that can be accomplished with other versions of *Pilot* by using ASCII codes or other roundabout methods, but *MicroPilot* makes their use a breeze. Another advantage relative to other versions of *Pilot* is that the author can run a program without loading special execution software. This makes editing and general debugging much faster.

Given all of the above praises, you may

Dr. Eliot S. Elfner, Associate Professor of Business Administration, St. Norbert College, De Pere, WI 54115.

GALAXY OF FEATURES

A GALAXY of features makes the **LNW80** a remarkable computer. As you explore the **LNW80**, you will find the most complete, powerful, ready to run, feature-packed personal and business computer ever made into one compact solid unit.

MODEL I COMPATIBILITY - The **LNW80** is fully hardware and software compatible with the Model I. Select from a universe of hardware accessories and software - from VisiCalc® to space games, your **LNW80** will launch you into a new world of computing.

FULLY LOADED - A full payload includes an on-board single and double density disk controller for 5 1/4" and 8" single or double sided disk drives, RS232C communications port, cassette and parallel printer interfaces are standard features and ready to go. All memory is fully installed - 48K RAM, 16K graphics RAM and 12K ROM complete with Microsoft **BASIC**.

QUALITY CONSTRUCTION - Instrumentation quality construction sets **LNW80** computers apart from all the rest. Integrated into the sleek solid steel case of the **LNW80** is a professional 74-key expanded keyboard that includes a twelve key numeric keypad.

HIGH RESOLUTION GRAPHICS & COLOR - The stunning 480 X 192 resolution gives you total display control - in color or black and white. The choice of display formats is yours; 80, 64, 40 and 32 columns by 24 or 16 lines in any combination of eight colors.

PERFORMANCE - Lift-off with a 4MHz Z80A CPU for twice the performance. The **LNW80** outperforms all computers in its class.

Our down to earth price won't send you into orbit

THE LINE IS RAPIDFIRE.
THE GAME IS....

CYTRON MASTERS

Introducing more than a new game...a whole new line of games — RapidFire from Strategic Simulations Inc.

RapidFire games give you the best in computer gaming by combining the best of two worlds: the fast-paced action and pure excitement of arcade games with the challenge and sophistication of strategy simulations.

A case in point: CYTRON MASTERS™

In the far-flung future, small armies of CYTRONS — Cybernetic Electronic Devices — have replaced large-scale warfare by sentient beings as the instrument for settling planetary disputes. Each army consists of shooter units wielding laser cannons, kamikaze-like mine cytrons, and devastating missiles. Bunker cytrons and anti-missiles serve to shield against enemy assaults.

To command these deadly but mindless machines is a military genius, who after long and rigorous training, has earned the revered title of...CYTRON MASTER!

Such is the power of the Cytron Master that the fate of an entire world hinges on his finely-honed skills.

Here, then, is your challenge — to become one of the Cytron Masters. The path may not be easy, but it sure is a lot of fun!

To get started today, simply travel to the nearest computer or game store on your planet.

\$39.95. On mini floppy disc for your 48K Apple®II with Applesoft ROM card or Apple III. ATARI® version coming this fall!

Also available now: GALACTIC GLADIATORS™, another RapidFire game!

VISA and M/C holders can order by calling 800-227-1617, ext. 335 (toll free). In California, call 800-772-3545, ext. 335. To order by mail, send your check to: Strategic Simulations Inc., 465 Fairchild Drive, Suite 108, Mountain View, CA 94043. (California residents, add 6.5% sales tax.)

CIRCLE 280 ON READER SERVICE CARD

be beginning to think that *MicroPilot* is nearly perfect. Well, don't run out and buy it without finishing this article. Along with its strengths, *MicroPilot* has several significant weaknesses.

Weakness

Probably the single most damaging weakness in *MicroPilot* is the fact that the student user has very easy access to the program. Any student with elementary programming ability can list a program, change it, and save it with little difficulty.

These operations can be done only while the user is in "command" mode, and when a *MicroPilot* program is running, the student would not normally be able to do any of the above dastardly deeds. However, there are several ways a student can find himself in command mode. The following is a list of some of these:

1) Since the Model I version of *MicroPilot* does not come with an Initial Program Load utility (I.P.L. utilities automatically begin the execution of a specified program when the computer is turned on), the student must either be supervised during initial program load or he must load and run his own program from the *command mode*.

2) Since *MicroPilot* has no ON ERROR GO TO command or its equivalent, any error (e.g., the student enters an O when the program expects 0, or makes an error in giving his log-on file code) will cause the program to crash and come down in *command mode*.

3) In addition to the above problems, there is no easy way to disable the Break key which halts execution and puts the user in *command mode*.

Before *MicroPilot* can be considered a serious educational tool, this easy access to command mode must be corrected. In other versions of Pilot, this has been done by separating the program execution software from the authoring software. This effectively prevents the listing or modification of programs by the student. If a program crashes under such circumstances, the student user can usually do only one of two things: 1) seek help from an assistant, or 2) type run and start again. This is as it should be.

As things stand with *MicroPilot*, a reasonably competent programmer could list test items and, by interpreting the program, get the correct answers before taking the test. An even more insidious possibility is that the student could directly modify his disk file indicating perfect performance on all unit quizzes without ever going through the course. This characteristic of *MicroPilot* makes it unsuited to some CAI applications.

While the easy access to command

mode is the major problem with this version of TRS-80 *MicroPilot*, there are a few other software characteristics that make for programming difficulties:

The programmer cannot POKE a value into a memory location in *MicroPilot*, nor can he call and execute a machine language program.

There is no way to check the DOS Directory from *MicroPilot*, or to specify the drive number when loading and saving programs and/or student records.

The documentation of the record keeping command is so unclear and incom-

The general documentation that is sold with MicroPilot assumes no former programming on the part of the user.

plete that the programmer literally has to find out for himself by trial and error how the commands work and what they do. (Note: Always be sure you close a file immediately after reading or writing, or you could clobber the directory on your disk and lose access to all the programs on that disk.)

The general documentation that is sold with *MicroPilot* assumes no prior programming experience on the part of the user. Thus, it is very awkward and inefficient for the user who already has a programming background.

A disadvantage of *MicroPilot* relative to Basic is that it is limited to 32K, disk configurations of the TRS-80 Model I, or Model III. Thus, those with 16K, level II machines cannot use courseware developed in *MicroPilot*. However, courseware programmed in Level II Basic could be used in such configurations.

MicroPilot vs. Basic

Some comments are appropriate on the relative merits of *MicroPilot* and Basic as CAI courseware authoring languages. Basic is a full-fledged, flexible, programming language, capable of a wide variety of programming applications, including the development of CAI courseware. However, mastering Basic requires a great deal of programming skill, and expertise.

MicroPilot, on the other hand, can be implemented in simple applications quite easily. Almost anyone wishing simply to present some material, and check for understanding, could pick up the *MicroPilot* syntax quickly. However, taking advantage of the complete range of *MicroPilot* commands, and linking contingent feedback and progress skillfully, as required in good CAI courseware, demands the same level of ability and skill required of a Basic programmer. It seems that intricate CAI courseware would be equally difficult to program with either *MicroPilot* or Basic.

So if you are already a hot-shot Basic programmer you can probably get along without *MicroPilot*, but if you are expecting to limit your programming to educational and especially tutorial programming, you will probably find Radio Shack TRS-80 *MicroPilot* the easiest and most direct route to writing excellent software. □

It's Academic

Patricia D. Glenn

Did you buy an Apple II because "The kids can learn with it?" Or do you have an Apple or two in your classroom for Computer Assisted Instruction? Have you discovered that existing CAI courseware is either too expensive or not available for the courses you want to teach? Are your programming skills too limited to allow you to write your own lessons?

If you answered yes to most of these questions, then DataTech has a *partial* solution for you. This company has created an authoring system for courseware development to be used by the parent or teacher with limited computer experience. The program is called *Mentor*. *Mentor* should not be confused with Pilot, Logo or Ticcit as it is not a CAI authoring language. It is, instead, a programmed template that allows an educator to prepare instructional units composed of text, questions and graphics.

Structure

The *Mentor* user needs to know only how to insert a disk in the drive, turn on the Apple and type. The program is self-instructing. However, because the program uses a unique DOS, it is necessary to insert the disk before turning on the computer. This is clearly indicated on the first page of the documentation.

creative computing

SOFTWARE PROFILE

Aurora, CO 80013

The copy-protected program disk is called the *Mentor Master* and is used to create student diskettes. When the *Mentor Master* disk is booted, you are greeted by several text pages describing what you are about to do. This is followed by the *Mentor Master* Index consisting of nine options numbered 0 to 8 (see Figure 1).

Figure 1.

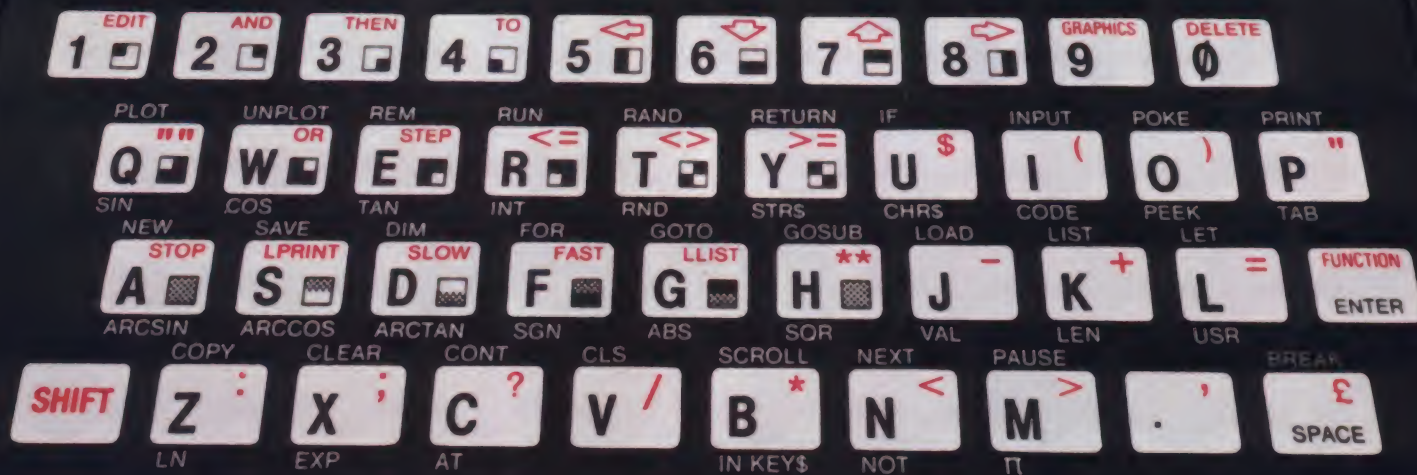

Mentor Master Index

- 0 - Run the Demonstration *Mentor* Program
- 1 - How to Construct a Complete Student Diskette
- 2 - Copy the *Mentor* Program onto a Blank Diskette
- 3 - Write a New Instructional Unit to be Added to a Student Diskette
- 4 - Read, Edit or Add to an Existing Instructional Unit
- 5 - Copy a Picture From One Diskette Onto Another
- 6 - Create, Change or Verify Table of Contents
- 7 - Read the Catalog of a Diskette
- 8 - The Game Show Index (only on disk containing The Game Show)

**Finally
you can afford
to satisfy
your lust for
power.**

ZX81

For \$99.95 you can have a full powered personal computer.

Most people know by now that the ZX81 from Sinclair Research is the lowest priced personal computer in the world.

But serious programmers are looking for more than a low price. They're looking for true computer power. And that's where the ZX81 surprises a lot of people.

Just look at the keyboard and you'll get some idea of the ZX81's power. It has more than 60 BASIC commands, 20 graphic symbols, and complete mathematical functions. And there's even more power that you can't see.

A breakthrough in personal computers. The ZX81 offers features found only on computers costing two or three times as much.

Just look at what you get:

- Continuous display, including moving graphics
- Multi-dimensional string and numerical arrays
- Mathematical and scientific functions accurate to 8 decimal places
- Unique one-touch entry of key words like PRINT, RUN and LIST
- Automatic syntax error detection and easy editing
- Randomize function useful for both games and serious applications
- Built-in interface for ZX Printer
- 1K of memory expandable to 16K
- A comprehensive programming guide and operating manual

Sinclair programs are available

16K Memory Module

The ZX81 is also very convenient to use. It hooks up to any television set to produce a clear 32-column by 24-line display. And you can use a regular cassette recorder to store and recall programs by name.

What you get. When you order your ZX81, you get everything you need to start programming.

It comes with connectors for your TV and cassette recorder, an AC adaptor, and a free programming guide and operating manual that completely documents the capabilities of the ZX81.

Options and add-ons. Like any full-powered computer, the ZX81 can be expanded and upgraded.

Its 1K memory can be expanded to over 16K just by plugging the Sinclair Memory Module onto the back of the unit. The cost is only \$49.95.

Sinclair has also published pre-recorded programs on cassettes for your ZX81. We're constantly coming out with new programs, so we'll send you our latest software catalog when you order your computer.

How did we do it? The question most often asked about the ZX81 is, "How can so much computer power cost so little money?"

The answer is that Sinclair Research simply took a different approach. Our only goal was to make programming power as affordable as possible. So we developed a radical new design that cuts costs dramatically without cutting computer power. For example, our unique Master Chip replaces as many as 18 chips used in other personal computers.

The success of the ZX81 speaks for itself. It is now the fastest-selling personal computer in the world. And we stand behind our product. If anything goes wrong in the first 90 days, we'll repair or replace your unit free of

charge. Even after that, you can take advantage of our national service-by-mail facilities for a minimum fee.

Order now and try it out for 10 days. Simply send the coupon along with a check or money order. For faster delivery, call our toll-free number and use your MasterCard or VISA.

You have 10 days to try out the ZX81. If it isn't all we say it is, just send it back and we'll refund your money.

Why wait any longer? With the Sinclair ZX81, you can finally afford to have the computer power you've always wanted.

Call toll free 800-543-3000. Ask for operator #509. In Ohio call: 800-582-1364; in Canada call: 513-729-4300. Ask for operator #509.

Phones open 24 hours a day, 7 days a week.

Have your MasterCard or VISA ready.

Lesson Development

The Index suggests "If this is your first time, select #0 then #1." Selecting Option #0 provides you with a rather uninspiring demonstration program. Next, you select Option #1: "How to Construct a Complete Student Diskette." This option is four pages of text referring to four other options, giving some cautions and eventually referring you to Option #2: "Copy the *Mentor* program onto a blank diskette."

If you are still undaunted, you select Option #2 when you are returned to the Index. There, you are presented with two more pages of explanatory text and a list of directions to follow. If you follow the directions faithfully, you will have a student diskette at the end of the process.

Returning to the Index, you decide to try Option #3: "Write a New Instructional Unit." A word of caution: plan your lesson on paper first. *Mentor* lessons are tutorials and have the following form:

1. Information.
2. Question.
3. Student Response.
4. Feedback.
5. Explanatory text for the next question.

If the teacher has not structured the lessons adequately, the result will be worse than useless. Tutorial lessons of the type produced by *Mentor* will only be as interesting as the thought put into their preparation make them. Creativity of presentation lies with the teacher, not the program. This process is time-consuming, but ultimately worthwhile.

Finally, in Option #3, you begin writing your instructional unit. First, you will be asked the title of your unit. As instructed, write down the *exact* title of your instruc-

tional unit, as you will need it later when preparing the table of contents. Each student diskette can contain up to eight instructional units, depending on the number of pictures used and the length of the question.

Next, you are asked to type in the name of the picture to be used with the unit. Inserting the picture itself is a separate operation under Option #5. Units may be prepared without pictures, and there can be only one picture per unit.

Following the picture name, you are instructed to write an introduction to the unit. This introduction can be review, discussion or any text that will fit into the eight text "pages" of up to seven lines provided for by the program.

Following the introduction, there is room for up to 97 true/false, multiple choice or fill-in (one word only, exactly as spelled by the teacher) questions which can refer to the picture for the unit. Only those questions coded for a picture will offer it and students can toggle back and forth between the picture and the text.

After each question, there is a provision for eight to twelve further lines of text. This text can be an explanation of the question, discussion, new material or whatever you wish. Normally, the test is immediately followed by a question about the material. After the unit is completed and the picture added, the table of contents is created and the unit is complete. Not bad for \$39.95. But there's more....

Editing Completed Units

As the teacher is entering the questions and text when preparing an instructional unit, there is no need to worry about hyphenation or truncation of words as text arrangement is taken care of by a

word processing sub-routine within the program. This allows text to be entered without concern for margins, which is a nice touch.

If, in spite of the self-instructing features of *Mentor*, you make a mistake in your instructional unit, you can correct it with the editor (see Figure 2), which allows you to make changes in questions or text, add questions, or delete entire instructional units.

Figure 2.

MEMOPAK

MEMOPAK

MEMOPAK

MEMOPAK

MEMOPAK 64k memory extension for **\$179.95** Give your diminishing memory more byte.

MEMOPAK 64K RAM \$179.95

The Sinclair ZX81 has revolutionized home computing. The MEMOPAK 64K RAM extends the memory of ZX81 by a further 56K to a full 64K. It is neither switched nor paged and is Directly Addressable. The unit is user transparent and accepts such basic commands as 10 DIM A (9000). It plugs directly into the back of ZX81 and does not inhibit the use of the printer or other add-on units. There is no need for an additional power supply or leads.

Description of memory

0-8K . . . Sinclair ROM

8-16K . . . This section of memory switches in or out in 4K blocks to leave space for memory mapping, holds its contents during cassette loads, allows communication between programs, and can be used to run assembly language routines.

16-32K . . . This area can be used for basic programs and assembly language routines.

32-64K . . . 32K of RAM memory for basic variables and large arrays. With the MEMOPAK 64K extension the ZX81 is transformed into a powerful computer, suitable for business, leisure and educational use, at a fraction of the cost of comparable systems.

MEMOPAK 16K RAM \$59.95

With the addition of MEMOPAK 16K, your ZX81 will have a full 16K of Directly Addressable RAM. It is neither switched nor paged and enables you to execute longer and more sophisticated programs and to hold an extended data base.

The 16K and 64K Memopaks come in attractive, custom-designed and engineered cases which fit snugly on to the back of the ZX81 giving a firm connection.

Free service on your MEMOPAK

Within the first six months, should anything go wrong with your MEMOPAK, return it to us and we will repair or replace it free of charge.

Try MEMOPAK with no obligation

You can use our MEMOPAK in your home without obligation. After 10 days if you are not completely satisfied, simply return it for a full refund.

Coming soon

A complete range of ZX81 plug-in peripherals:

MEMOTECH Hi-Res Graphics
MEMOTECH Digitising Tablets

Mentor Master, continued...

alien starship shooting missiles at the players' shuttle craft. It is operated entirely from the keyboard, using the #1 key and the #0 key to fire at the missiles.

Each player tries to shoot down the alien missile on the opposite side of the screen. The first player to hit an alien missile gets four points for a direct hit, or two points for a disabling hit. In order to keep the points gained, the player must immediately give the correct answer to a question. The questions are the true/false and multiple choice questions from the instructional units, and include the pictures used in the units.

Different units may be combined to make up the question set for The Game Show although there can still be only one picture per unit. The instructional units are easily converted for use in The Game Show through the options included in the Game Show Index.

Educational Value

How you feel about the educational value of the *Mentor* program will depend to a great extent on your philosophy of the proper uses of CAI. If you feel that CAI should deal exclusively with "micro-worlds," extensive hypothesis testing, variable manipulations and education-oriented languages such as Logo, then *Mentor* is clearly destined to be a disappointment. Frankly, *Mentor*-authored tutorials are of the "electronic page turner" variety.

However, for \$39.95 it is probably unreasonable to expect much more than that from the program. But what it does, it does very well. It allows a teacher to present specific information to the student, and to be reasonably certain that the student understands it.

Currently, and in the foreseeable future, there is a place for such a program within the educational establishment. If tutorials and drill and practice programs are a means for increasing the acceptance of computers in the schools, then they should be used.

The Mentor program tries very hard to be user-friendly to the inexperienced computer user.

Program Design

The *Mentor* program tries very hard to be user-friendly to the inexperienced

computer user. In fact, it tries so hard that it is decidedly *unfriendly* to anyone with even basic computer skills. For example, in trying to meet the needs of a user with only one disk drive, the program makes no provision for using two drives. Considering the amount of disk swapping that is necessary simply to prepare a student diskette, it would be desirable to have the capacity to use two drives if they were available.

The disk is copy-protected and unlistable, so it is impossible to modify the program. This copy protection is probably responsible for most of the program design problems I have found.

The program has two responses to the student's input: "You're right," and "Sorry, try again." This, I think, ignores one of the strengths of CAI—the use of varied motivational techniques—and there is no way for the teacher to change these responses.

When I prepared my first instructional unit, I didn't know the program would accept only one-word fill-in answers. My question required two words. When the student diskette was run, the program crashed when it came to the fill-in and refused to go any further. No matter what I entered, it endlessly repeated "Sorry, try again." The only escape was the RESET key.

Beginning to study a *Mentor* unit is a lot like going down the first hill on a roller coaster. The only way to get off is to ride it to the end. Once a student has begun a unit, the only exits are completing the unit or hitting the RESET key. If you must stop, you will have to begin the unit again.

Students are given three opportunities to answer, and are then given the correct answer, which must be entered before the program will proceed. The learning process could probably have been better served by having the program branch to an explanation of the troublesome material after two or three incorrect answers. If this is too complex, perhaps it could at least return to the explanatory material presented earlier.

Mentor makes no provision for class management. The teacher has no way of knowing who has used the unit, what units they studied, how well they did, or what their problem areas were. This kind of feedback is essential. It is through a knowledge of how course material is being used that a teacher is able to refine the presentation. I suspect this lack is caused by the author's determination to get the entire program and all the instructions on one disk. I would rather have had a management system with the instructions in the printed documentation. Still, for the price, I am probably asking

for too much. *Mentor* is not a bad program although it could be less "author-friendly" and more "student-friendly."

The Picture Disks

DataTech has prepared a series of seven Picture File Diskettes, all in the natural sciences (see Figure 3). These disks contain generally good, clear hi-res graphics of common textbook diagrams (see Figure 4). Each diagram has the important points marked by either a letter or a number for ease of reference. Occasionally, it is difficult to determine what a letter is referring to, unless the student is familiar with a line drawing of the object (see Figure 5).

The Picture Files would be useful from middle school through introductory college courses.

The Picture Files would be useful from middle school through introductory college courses. The graphics are in full color, but are understandable in black and white. If you are teaching a course for which Picture Disks are available, and do not have the capability to do your own graphics, the DataTech disks will do much to enhance your *Mentor* presentation, and at a reasonable price. They are one of the best features of the program.

If you can do your own graphics, *Mentor* has made provision for you to use them in the instructional units. You draw your graphic on hi-res page 1, save it, and then use the saved picture as you would a graphic from a picture file diskette.

Ease Of Use

As I pointed out earlier, *Mentor* is an *extremely* user-friendly program. The author, Peter E. Holden, has tried to anticipate every mistake an inexperienced user might make (except for two word fill-in questions). Invalid input is either not accepted, or causes an error message to be displayed telling you what may be wrong. All instructions are displayed on the screen so there is very little need to refer to the printed documentation. The lone exception to this is The Game Show program. There was not enough room on

**We don't give them the answer.
We show them how to get it.**

New Milton Bradley Educational Software.

At last: programs that really make your kids think.

Most software only offers your students drill and practice. That's why it fails your class.

But with new Milton Bradley programs, they don't just stumble into the answer . . . they understand how they got it.

Clean, clear graphics make the lessons easy to follow, and engaging special effects make the learning fun.

Easy to use for both you and your students.

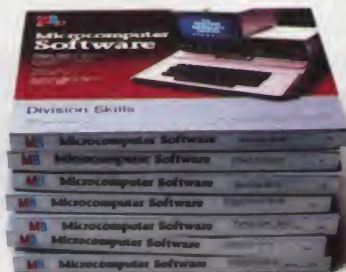

Just slip in the diskette. Students follow simple instructions; they don't need tutoring to operate the program.

Programs progress through a range of skill levels. Each unit is organized by specific topics, to adapt easily to your lesson plans.

Track their progress in seconds.
Our streamlined management sys-

tem shows you with a glance which skills each student has mastered and which areas need more work. Just follow the easy steps in our accompanying Teacher's Guide.

In addition, we've created reproducible activity sheets keyed to each skill. Now you can give more individual help to each student—on or off the computer.

Choose from seven units: **Division Skills; Mixed Numbers; Decimal Skills; Vocabulary Skills:** Prefixes, Suffixes, Root Words; **Vocabulary Skills:** Context Clues; **Punctuation Skills:** Commas; **Punctuation Skills:** Endmarks, Semicolon, Colon.

THE COMMODORE 64. ONLY \$595.
What nobody else can give you at twice the price.

"THE COMMODORE 64 COULD BE THE MICROCOMPUTER INDUSTRY'S OUTSTANDING NEW PRODUCT INTRODUCTION SINCE THE BIRTH OF THIS INDUSTRY."

—SHEARSON/AMERICAN EXPRESS

They're speaking to a group as interested as anyone else in the future of computers: the people who buy stock in the companies that make computers.

If, on the other hand, you're a person whose livelihood depends on a personal computer—or whose leisure time revolves around one—what follows should impress you even more than it impresses investors.

MIGHT MAKES RIGHT.

The value of a computer is determined by what it can do. What it can do is largely determined by its memory.

The Commodore 64's basic RAM is 64K. This amount of power is unusual enough in a micro at any price.

At \$595, it is astonishing.

Compared with the Apple II⁺, for instance, the Commodore 64[™] offers 33% more power at considerably less than 50% of the cost.

Compared with anything else, it's even more impressive.

PILE ON THE PERIPHERALS.

Because the basic cost of the 64 is so low, you can afford to buy more peripherals for it. Like disk drives, printers, and a telephone modem that's priced at around \$100.

This means you can own the 64, disk drive, printer and modem for a little more than an Apple II⁺ computer alone.

HARD FACTS ABOUT SOFTWARE.

The Commodore 64 will have a broad range of custom software packages including an electronic spreadsheet; business graphics (including printout); a user-definable diary/calendar; word processing; mailing lists, and more.

With BASIC as its primary language, it is also PET BASIC compatible.

The Commodore 64 will also be programmable in USCD PASCAL, PILOT and LOGO.

And, with the added CP/M[®] option, you

will have access to hundreds of exciting software packages.

THE FUN SIDE OF POWER.

The Commodore 64 can become very playful at a moment's notice.

You can use Commodore's plug-in game cartridges or invent your own diversions. All will be enhanced by brilliant video quality (320 x 200 pixels, 16 available colors, 3D Sprite graphics), plus outstanding sound.

The 64's built-in music synthesizer has a programmable ADSR (attack, decay, sustain, release) envelope, 3 voices (each with a 9-octave range) and 4 waveforms. All of which you can hear through your audio system and see in full color as you compose or play back.

NOW'S YOUR CHANCE.

If you've been waiting for the "computer revolution," consider it as having arrived.

Through its 25 years of existence, Commodore has been committed to delivering better products at lower prices.

Today, the company's vertical integration has resulted in the Commodore 64's price performance breakthrough heralded by Shearson/American Express.

Visit a Commodore Computer dealer and discover the 64 soon.

It will expand your mind without deflating your wallet.

CP/M[®] is a registered trademark of Digital Research, Inc.

the single disk for The Game Show instructions, so they are on a separate printed sheet. Mr. Holden has thoughtfully provided extra copies of these instructions. However, this illustrates my point about student-friendliness versus teacher-friendliness.

Documentation

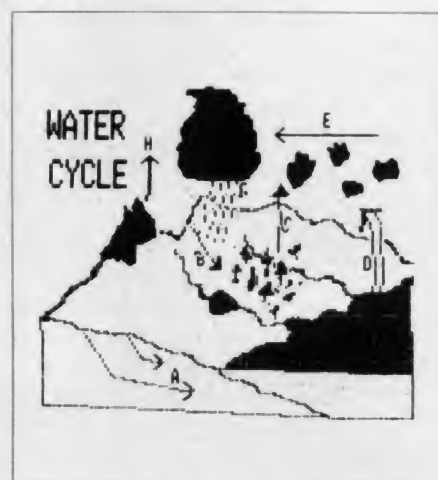

Mentor needs little documentation. However, it is there. The teacher's manual begins with the assumption that the teacher knows little more than how to turn the computer on. In a conversational tone, it explains the basics of the program and leads the reader through the creation of a sample instructional unit. It does not repeat the instructions found on the disk, but rather expands and explains them.

Included as part of the documentation is a print-out of the instruction sets found on the disk. This is convenient, as it is sometimes possible to forget where you are, and then discover that the instructions have disappeared from the screen. It is also a good way to get an overview of the way in which the program parts mesh.

Summary

In all, *Mentor* is a good program, and a good dollar value. It is not a perfect program, but few are. Mr. Holden is to be thanked for providing a program that recognizes current thinking of the edu-

Figure 5.

cational community, and one which attempts to ease the passage of computers into the classroom. This is a *good* program. With just a few minor changes, it would be an excellent one. □

“The question facing schools today is not whether they can afford to implement computers into the instructional program, but rather whether they can afford not to.”

Dr. John L. Bristol, Superintendent
Lyons Township School System
La Grange, Illinois

**How Your School System
Can Meet the Future
With Radio Shack TRS-80 Computers**

LA GRANGE, Ill. — The man behind one of the most successful computer-education programs in the nation has said flatly that schools must face the growing need for both computer-assisted instruction (CAI) and computer literacy as an educational fundamental.

Speaking before a meeting of the Midwest Suburban Superintendents Association, Dr. John L. Bristol, Superintendent of the Lyons Township School System in La Grange, also said, "Computers so pervade our society — they're in homes, cars, industry — that knowing how to use them is as important as knowing how to read and write."

Indeed, such important groups as the President's Science Advisory Committee have urged that all high school students be taught about computers.

But the question that most people — educators and taxpayers alike — wonder about is how can a district reach a computer-education goal without breaking an already overstrained budget.

If you ask Dr. Bristol, he will describe how the Lyons District has achieved 100 per cent computer literacy in its faculty and high school student body in the course of just two years with an investment, on a per student basis, of less than the average textbook.

How did they do it?

"We committed ourselves," Dr. Bristol explains, "first to defining the role of computers in the education of all students and then to developing and implementing a plan in a rapid systematic manner."

"All" is the key word here.

According to Dr. Bristol, the first two principles that their plan was to be based on were that all 3900 La Grange highschool students — not just gifted or math-oriented ones — were to learn to use computers, and that all teachers would, too.

"We committed ourselves . . . to defining the role of computers in the education of all students and then to developing and implementing a plan . . ."

Dr. Bristol sees several advantages to following a pattern like that used in La Grange.

"The first priority is computer literacy on the part of all students. That requires that they all be taking courses that involve computers. They shouldn't be forced to make a choice between Physics 1 and Computers 1 in order to gain a basic knowledge of computers."

"But it also requires that there be situations where there is one computer for each student in a laboratory taught by someone who is already computer literate."

"What is more logical than having teachers bring their classes to the lab periodically and teach them using the computers? The computer is then an integral part of all existing programs . . . not something for others or to be done by others."

"The cost per student was well below that of the average textbook..."

"The students gain two ways: they learn about the subject and they learn about computers."

"And we gain as well. We do a better job preparing them for the computerized future. And we improve our teaching by making use of an aid that students always find interesting."

Nevertheless, the cost of setting up a program like that found in La Grange was surprisingly low when viewed on a cost-per-student basis.

As Dr. Bristol says, the Lyons district instituted computer-assisted instruction in a big way—it is currently using over 250 TRS-80 computers. This insured not only that all La Grange students both can and will take

advantage of the computers, but that the district can show an excellent cost-per-pupil ratio.

Assuming a cost extension of five years and use by approximately 8,000 students per year, the cost per student is \$4.78 for the hardware and \$2.25 for the programs, or a total of a little more than \$7.00.

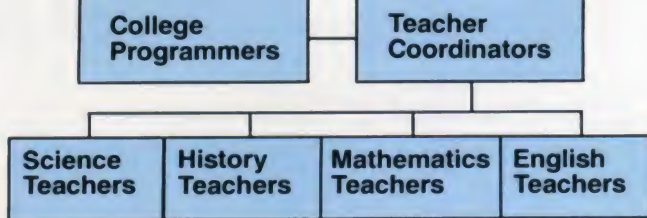

As Dr. Bristol notes, this figure is "well below that of the average textbook or library book." Yet not a single extra staff person was added to implement the program.

"The cost is a pretty small portion of the average district's \$1600 annual per pupil expenditures," Dr. Bristol concludes. "Yet it may yield more in . . . preparing youth for tomorrow than 10 other ways those dollars might be spent."

"The students gain two ways: they learn about the subject and they learn about computers. And we do a better job preparing them for the . . . future."

At La Grange, it was the teachers themselves who decided what courseware was needed. Their requirements were then translated by teacher coordinators to programming students of a nearby college.

Having established these principles, Dr. Bristol says, the district proceeded to implement its plan: select hardware, give all the faculty literacy instruction, let the staff determine appropriate applications for instruction, and develop programs to meet those applications.

To make the hardware selection, they first established their selection criteria, then invited suppliers to make presentations.

The criteria were “sophistication, easy repair, ability to upgrade, dependability, networking capability and flexibility in use.”

After surveying the available offerings, the district picked the Radio Shack TRS-80 Model III in two forms, 2-disk 48K “teacher’s computers” and 16K “student computers,” connected by a Radio Shack network system.

“Teachers are the implementors of curriculum changes, but how could they design ways to use computers in their courses . . . when they themselves were educated in a noncomputerized era?”

One teacher’s computer and 26 student computers, plus a printer, were purchased for each of eight high school computer labs.

The next stage was to gain computer literacy, the ability to use computers with pre-developed programs, among the faculty. In La Grange, eight teachers, who had previously been instructed by outside experts, taught the rest of the district faculty during special summer training sessions.

The Lyons district felt that 100 per cent literacy among teachers was essential for proper use of the computers, and Dr. Bristol feels this conclusion has been proved correct.

"Teachers are the implementors of curriculum changes," he says, "but how could they design ways to use computers in their courses, and regularly give students 'hands-on' experience in 'course-specific' computer drills and programming, when they themselves were educated in a non-computerized era?"

However, once the faculty had attained a basic familiarity with computers, Dr. Bristol says, they were ready to begin making specific suggestions for how the computers could be used in courses they were familiar with.

From the expected math programs and spelling drills to the unexpected courses like health, music and home economics, La Grange teachers proposed ways they saw for the computers to help their students learn.

A home economics proposal described how students could use the computers to help pick the proper textiles for clothing projects.

"We had those who would implement the programs working on them, giving them a sense of both participation and control."

In a health course, a student would be able to find out the effect of alcohol abuse on various parts of the body — or how many calories are allowed to maintain an ideal weight.

Music teachers worked up an idea whereby computers could help teach basic chords and fingerings for a beginning guitar course.

All these, and many others, have since been put in the curriculum, balanced out among the various departments so that at least 50 per cent of the students at the two high schools will be taking computer-assisted courses at any time.

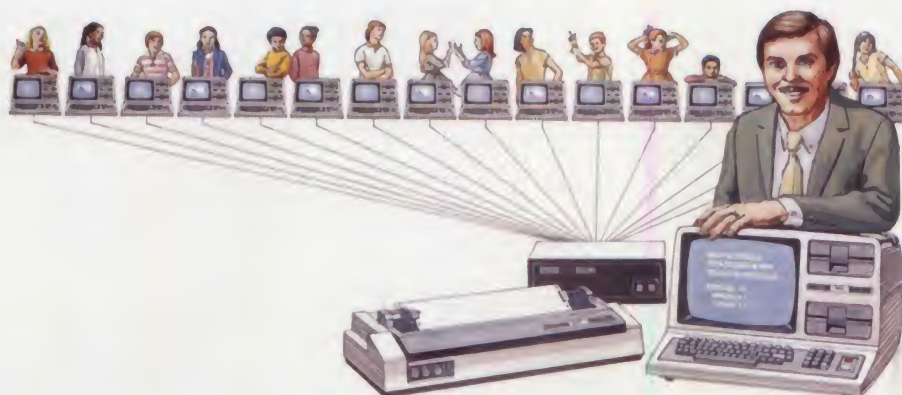

Lyons accomplished this by setting up teams to evaluate the proposals and then to work with college student programmers and "teacher coordinators" from within the faculty in developing them.

In using programmers to write the software, but not to run the system, Dr. Bristol says, the district accomplished two things.

"We got programs that were designed specifically to meet the needs of our students and curriculum. And we had those who would implement the programs working on them, giving them a sense of both participation and control."

"The first priority is computer literacy on the part of all students. That requires that they all be taking courses that involve computers. They shouldn't be forced to make a choice between physics and computers . . ."

Radio Shack's State-of-the-Art Classroom Computer Networks Mean Greater Instructional Usefulness at a Lower Cost to You

The New Network 3 Controller and Operating Software Allows Low-Cost TRS-80 Model III Microcomputers To Access Programs Simultaneously!

FORT WORTH, Tex. — Radio Shack's versatile, yet easy-to-use Network 3 Controller System is quickly becoming one of the most popular systems in educational computing because it allows up to sixteen non-disk Model III student stations to access a single teacher's "host" station.

Each student can thus choose from lessons that are stored on disk in the host, freeing teachers from the burden of loading one lesson after another into individual stations, and giving them more time to spend with students who need extra help.

As lessons with student record keeping are completed, scores are automatically stored on the host disk for later review.

Students also like the Network 3 because it

allows them to send work off to be printed without waiting, and to continue with new projects immediately.

Computer science classes find it especially helpful since they can access most of the features of Disk BASIC using non-disk student stations.

Administrators and school boards love the Network 3 because it's so cost-effective. Just one disk-based Model III is needed for every 16 non-disk units. It's like having a disk-based computer at every desk.

As school districts like La Grange, Illinois, Rosemount, Minnesota, and hundreds of others across the country have discovered, a TRS-80 Model III Network makes sense — and saves dollars.

TRS-80 Courseware Can Help You "Computerize" Your School System

FORT WORTH, Tex. — In addition to providing the most cost-effective equipment available, Radio Shack smooths the transition to CAI (computer-assisted instruction) by providing a large selection of instructionally sound and properly validated educational materials.

Relying on outstanding teachers, administrators and curriculum specialists for expert advice, Radio Shack has designed and field-tested courseware packages on mathematics, programming, reading, history — plus aids for teacher-designed courses.

For more information, and the name of the full-time Educational Coordinator in your area, call Radio Shack's Education Division at 800-433-5682 toll free. In Texas, call 800-772-8538.

The Friendly Computer Languages

Jim Muller

They're everywhere these days: in homes, offices, laboratories, cars, industrial controls, kitchen appliances, radios and TV sets, security systems, and children's toys. "They" are, of course, the ubiquitous microcomputer, the millions of single chip devices controlling a host of consumer products, the board-level systems controlling industrial processes, and, of course, the desktop computer through which a rapidly increasing number of laypeople are becoming involved in the microcomputer revolution.

To some, this proliferation of computer technology heralds an exciting new revolution. To others, it is simply revolting.

Recently, however, that negative opinion has begun to change, as new user-friendly languages are introduced for personal computers. No longer does the newcomer to the world of computers have to cope with such alien words as INIT, CHR\$, GOSUB, STR\$, REM, and DIM. A rapidly growing number of young people and the young-at-heart are entering the world of microcomputers riding on the back of a turtle.

Not long ago, the turtle was an electromechanical pet that roamed the floor, controlled by a sizable computer and a simple child-oriented keyboard. Youngsters could manipulate the turtle through the keyboard to make it draw pictures on large sheets of paper. The turtle had a unique pen that it could raise or lower to draw figures.

In drawing pictures of houses, animals, or just geometric shapes, youngsters gained valuable experience in logical thought and problem-solving. Each task had to be broken down into the simplest steps, and then assembled in a structured procedure to accomplish that task. If the drawing was not correct, they went back and refined the procedure until it was drawn the way they wanted.

Now the turtle resides on the computer display screen in the shape of a small triangle. But it will still draw pictures, responding to simple commands to go FORWARD, BACK, LEFT, or RIGHT. These turtle graphics commands were first introduced to microcomputers through the Logo language, but are now being incorporated into an increasing number of languages and personal computers.

Just as you select a car to suit your own personal tastes, so you should select a turtle graphics language.

Last summer, while watching a group of youngsters manipulate the cybernetic turtle around the screen to create some dazzling graphics, it struck me that these young people needed a place in which they could fully explore the world of microcomputers and microelectronic technology. They needed their own orga-

nization through which they could come to know what different computers could do, what languages such as Logo, Pilot, Basic and Pascal were all about. They not only needed the chance to explore the computer, they needed the challenge to excel. From this, the Young Peoples' Logo Association has evolved with a membership of Turtles that span all 50 states, and a growing number of foreign countries.

At first the choices were easy. Throughout 1981, Logo was available only on the TI 99/4 computer. And, through turtle graphics and the sprite mode our young Turtles were soon developing procedures to accomplish all sorts of colorful things. We occasionally used Big Trak, the programmable truck from Milton Bradley, to help demonstrate the Turtle commands of FORWARD, RIGHT, LEFT, and REPEAT to show how a picture had to be broken down into each step the turtle was to take.

By programming Big Trak to go around the Ping Pong table and under the bench, and to fire its phaser at the dog, for example, youngsters were able to visualize the steps needed to guide the Turtles around the screen to accomplish complex geometric tasks.

Atari Pilot

Then came Atari Pilot with turtle graphics, followed quickly by two versions

```
T: "Please enter a distance."
A: #A
GR: *HERE

GR: PEN RED
GR: 4(DRAW #A; TURN 90)
```

```
C: #A = #A + 2
```

```
J: *HERE
```

```
T(ype): "Please enter a distance."
A(ccept): #A (#A is a variable)
GR(aphics): *HERE (Sets up the Label,
"HERE."
Tells the pen to draw in red "ink."
GR(aphics): 4(DRAW #A; TURN 90) Repeat
the operations within the brackets four
times.--the turtle will draw a red
line #A units long and then turn right
90°, putting a red box on the screen.
C(ompute): The value of #A = The value
of #A plus 2.
J(ump to): *HERE, or to the Label, "
HERE," and repeat the process.
```

Figure 1.

Jim Muller, President, Young Peoples' LOGO Association, Richardson, TX 75081.

Friendly Computer, continued...

of MIT Logo for the Apple II, and then Apple Logo. Turtle graphics is also available through other languages and systems in one form or another. Of course, Big Trak has been available for a few years, offering a rudimentary introduction to turtle graphics. This makes it increasingly difficult to recommend what parents and teachers should buy for their own Turtles.

Just as you select a car to suit your own personal tastes, so you should select a turtle graphics language. For example, for the novice driver, the simpler, economy model may be the best vehicle. For under \$500, an Atari 400 computer and a colorful, easy-to-use language, Atari Pilot with turtle graphics, is made readily available to youngsters from primary grades up.

In addition to offering enjoyable turtle graphics features and advantages, Atari Pilot offers the unique feature of an easy transition to Basic and other common microcomputer languages. For example, it shares some common format and editing features with Basic.

Pilot, for Programmed Inquiry, Learning, Or Teaching, is a very conversational language which uses simple line abbreviations to prescribe the function of that line. It was developed initially as an easy-to-use authoring system for educators, and Atari has added turtle graphics features to the language to make it more user-friendly. (See Figure 1.)

If I choose to retain this short program for drawing a box, I can do so by simply entering the command AUTO followed by the label *BOX and the program. To mark the end of the program, enter E: When listed, the program would look like this:

```
10 *BOX
20 T: PLEASE ENTER DISTANCE.
30 A: #A
40 *HERE
50 GR: PEN RED
60 GR: 4(DRAW #A; TURN 90)
70 C: #A = #A + 2
80 J: *HERE
90 E:
```

The program is run by first clearing the screen to set up the graphics mode with GR: CLEAR. Then the Use command is entered "U: *BOX. An endless series of red boxes will be drawn on the screen. However, that can be limited by simply changing line 80 to read:

J(#A 45): *HERE

Now, boxes will be drawn until the dimension of a side equals 5.

Boxes and other figures can be placed at any coordinates on the screen. The turtle can draw in yellow and blue, as well as red. There is also a command to

FILL a box or a house, so you can make a city of little boxes or colorful skyscrapers.

The language offers sound effects and assembly language access to add some truly spectacular effects. It is also recursive in that commands such as *BOX can be used in other procedures. It also offers some very interesting text manipulation capabilities for easy lesson programming, as well for developing word games.

The greatest asset of the language is spectacular documentation that is heavily illustrated, thorough, and very easy to understand. Also included are two well-done demonstration tapes that orient the user to the capabilities of the language.

However, Atari Pilot has some distinct limitations when compared to the various implementations of Logo. The language is much smaller in size and in scope. But, when it comes to the practical real-world situation of economically providing youngsters with the opportunity to explore the fun and excitement of personal computing, Atari Pilot is an excellent choice and an excellent introduction to the Atari computers. The books that

The sprite mode is especially useful for elementary grade youngsters.

accompany the language do as much to make the computer user-friendly as does the language itself.

Three Versions

There are currently three versions of Logo available through four companies: TI Logo from Texas Instruments, MIT Logo for the Apple computer from Terrapin, Inc. and Krell Software Inc., and Apple Logo developed by Logo Computer Systems, Inc. of Canada, and distributed by Apple Computer Inc.

TI Logo requires the basic TI 99/4A console plus Extended Memory and the TI Logo command module. The suggested retail price for the minimum system is just under \$1000. The versions of Logo for the Apple II computer require at least one disk drive, extension of the basic memory to 64K, and the language, bringing the suggested retail price for the complete system to around \$2400. The language alone is available from Terrapin, Inc. at \$149.95 and from Krell Software for \$179.95. The Krell version includes an extra demonstration disk called "Alice in Logoland," which takes the user

through examples of virtually all of the capabilities of the language. Apple Logo is available for \$175 and comes with two excellent, heavily-illustrated books. In terms of documentation, Apple Logo and Atari Pilot are the two very clear-cut standouts.

All of the versions of Logo offer a turtle graphics mode which moves the turtle around the screen to draw geometric shapes and patterns. The Apple versions each offer five pen and background colors whereas TI Logo offers sixteen colors. In the MIT versions of Logo, the shape of the turtle may be redefined and moved around the screen to create animated procedures. TI Logo, however, offers 32 Sprites which may carry or look like 27 shapes. These shapes may be any of five predefined shapes in the language, or they may be defined by the user. The shapes will not, however, draw lines.

Sprites

The sprite mode is especially useful for elementary grade youngsters in that it provides a very colorful means for them to become actively involved with the computer right away. It also provides the means for demonstrating what might otherwise be incomprehensible mathematical concepts.

For example, it is extremely difficult to explain the numerical concept of "zero" to young children. They have no knowledge of what "nothing" is. However, this abstraction becomes very real when they TELL :ALL (of the sprites to) CARRY O. Those sprites that are on the screen will then disappear.

There is, however, an inconsistency in TI Logo that can be quite confusing to young programmers. In the Turtle Mode, it is possible to SETCOLOR [6 15] and have the Turtle draw a red line on a white background. However, in the Sprite Mode, the computer will not accept this as an input. Only the pencolor can be specified with the SETCOLOR command.

A graphics board that provides animation capabilities for Apple Logo was demonstrated at the West Coast Computer Faire in March. This board allows 32 turtles to assume shapes designed into the language or by the user, allows for the use of 16 colors, and sets the turtles in motion with or without the pen drawing a line.

A valuable feature of the versions of Logo for the Apple Computer is the ability to select full screen or partial screen graphics. This can be done even while a procedure is in process. In the Turtle Mode, TI Logo reserves the bottom portion of the screen for text. In the Sprite Mode, the full screen is used with text written from the top of the screen.

NEW from MUSE Software

INTRODUCING

The Sensational Program

KNOW YOUR APPLE™

Instant Pleasure!
Delight Your Friends!

Educational Fun!
Gift Packaged!

- 1. Instant Pleasure:** Set up your Apple®, turn on the program, and enjoy your computer instantly!
- 2. Amaze and Delight your Friends:** Whether you're a new or long-time Apple owner, you can astonish your friends by letting them sit right down and enjoy your Apple, too!
- 3. Educational:** Gain instant knowledge about your Apple... how it works, and what it can do for you!

- 4. Gift Packaged:** An excellent gift for any Apple owner; for personal gifts, birthdays, and Christmas giving.
- 5. Collector's Item:** The box is a unique miniature replica of the Apple computer at no extra charge.

Everyone should have a "Know Your Apple"! "Without one, you'll be a 'byte' away from total Apple pleasure!"

PRICE: \$34.95

Apple Logo allows the user to select the option of having the Turtle "wrap" or not. Simple commands direct the turtle to reverse direction when it comes to the edge of the screen, or simply to disappear off the screen. In TI Logo, the turtle and the sprite always wrap around.

Logo for the Apple offers considerably more flexibility in both graphic and arithmetic operations through the use of floating point math. This allows for trigonometric, logical, square roots, and other math functions not possible through the TI integer-only system. In addition to the numerical flexibility, the Apple versions of Logo offer more graphic flexibility.

For example, consider the following simple procedure:

```
TO SPIRAL :DISTANCE :ANGLE
FORWARD :DISTANCE
RIGHT :ANGLE
MAKE "D :D + 1
SPIRAL :DISTANCE :ANGLE
END
```

Running this simple procedure on the Apple computer will result in the drawing of an ever-increasing spiral. By entering SPIRAL 1 144, a star will be drawn that will increase in size each time it is drawn. The screen will eventually become totally white with only the turtle visible as it continues to draw. In TI Logo, however, the computer will signal OUT OF INK after about 25 repetitions of the procedure.

Apple versions of Logo provide interfacing to printers and other peripherals through assembly language access. The MIT versions of Logo for the Apple offer SAVEPICT and READPICT commands for saving and reading the contents of the screen into and from memory. The screen can also be printed out, a feature that is especially useful for showing screen graphics. Apple Logo does not offer these commands but they can be programmed. TI Logo offers no interfacing capability. Procedures can be printed on the TI Thermal Printer, and programs can be stored on tape or disk.

Logo and the Handicapped

Imagine the use of Logo by the physically handicapped wherein they have access to single-key commands that print out phrases and sentences. People with severe arthritis or other problems that limit their ability to type could still use the computer to communicate by entering a single key command.

For example:

```
TO G
CLEARSCREEN
PRINTER
PRINT [YOUNG PEOPLES' LOGO ASSOCIATION]
PRINT [1208 HILLSDALE DRIVE]
PRINT [RICHARDSON, TEXAS 75081]
PRINT [ ]
PRINT [DEAR YPLA:]
END:
```

By simply typing the letter G and enter, the address of the YPLA and opening of the letter would be printed out on the printer. With a menu of useful phrases and sentences, the handicapped have a new means of communication readily available to them. And this list can be altered very easily to serve new requirements.

Another benefit of assembly language access through Apple versions of Logo is the ability to create new features in the language, such as music and sound effects. This also gives the user access to

The real power of Logo for the Apple computer becomes evident with the list processing capabilities offered by each.

16-color low-resolution graphics and the chance to alter the character set. TI Logo allows direct access to the character set by which youngsters have created their own alphabets and codes. There is no access to music or sound capability in this version, however.

The value of TI Logo is in its graphic capabilities and its user-friendliness for very young children. When the idea for the YPLA was being formulated last summer, junior high students and first graders used to get together around a few computers on a Ping-Pong table with the intent of duplicating their favorite arcade games through the computer or simply drawing colorful flowers. Not only did they all find the TI 99/4 exceptionally easy to use, they found that TI Logo offers very easy access to some exciting graphic and game programming capabilities.

We have had a variety of games developed including versions of lunar lander, flight control, crossing the asteroid belt, and similar exercises. Primary grade

youngsters have developed some very interesting pictures, not to mention our first computerized Christmas card. The "human factors" designed into the language make it an excellent choice for elementary and junior high schools, and for those age groups at home. Unfortunately, the documentation that accompanies the language leaves a lot to be desired.

For example, a variety of undocumented commands have been found in TI Logo. FPUT, LPUT, THING, NUMBER?, WORD?, THING? are among these. The manual accompanying TI Logo was supposedly written for middle school age children, which makes it difficult to understand why the joystick commands, JOY1 and JOY2, were omitted.

Not only do these commands make the language competitive with several other child-oriented software packages, they offer some very interesting opportunities for using TI Logo with the handicapped. Each position of the joystick represents a different numerical input, and a simple rewiring or rebuilding of the joystick would offer the physically handicapped access to the computer.

Documentation

The documentation problems with TI Logo are reportedly being corrected, and a TI Logo Curriculum Guide is being published. In addition, several authors are preparing books on TI Logo for various age groups. Thus, this problem should disappear, hopefully as this article is being published.

The real power of Logo for the Apple computer becomes evident with the list processing capabilities offered by each. These capabilities tend to make these versions more complete computer languages. However, there are some differences worth noting. The MIT versions offer some editing and debugging commands which have to be programmed into Apple Logo. On the other hand, error handling in Apple Logo is generally more efficient in that error handling commands can be defined by the user.

The MIT versions of Logo for the Apple and the TI 99/4 were experimental developments. It would appear that Logo Computer Systems, Inc. learned from these experiments and has come up with a more complete language. Of course, it is reasonable to assume that all of the Logo developers are looking at improvements in the language. Thus, it will take more time to determine which version is going to become the "standard."

For the parent and teacher, there are, indeed, some tough choices. For the economy-minded, Atari Pilot is an excellent choice, the subcompact model that

Friendly Computer, continued...

offers excellent economy combined with efficient performance. This is not only because of the user-friendly benefits but because of its similarities to other more readily available programming languages. TI Logo is an expensive version of Logo, the intermediate model offering some unique benefits that will undoubtedly be improved and expanded in time. The TI computer is gaining rapidly in popularity and is being more actively supported by third parties, a good indication of the viability of the product.

The top-of-the-line resides within the Apple computer. To carry the analogy a step further, consider the version of Logo offered by Terrapin, Inc. as the solid, comfortable, efficient, four-door sedan. It is an excellent, long term investment backed by an experienced company. But would you teach a first time driver in a Mercedes or Cadillac El Dorado?

The Krell Software version appears to have more of a "luxury sports car" approach. It is a lean, dramatic package that offers comprehensive and colorful demonstration procedures. But in total, it is the model that requires some prior experience to use most efficiently.

Apple Logo is the Grand Touring model—solid, comfortable, dramatic, luxurious, well-documented, with outstanding performance. It stands out because of its thorough attention to detail.

In our Turtle Learning Centers in Irving and Richardson, TX, we use them all. Each has its own followers and supporters. Each language has its own advantages. But, most important, there is something for everyone.

Many computer owners may find it hard to relate to that statement. This is why the analogy of languages to automobiles goes far beyond selection in a showroom. A few years ago, I was actively involved in promoting an employer's products to the road racing field. Race drivers, the hobbyists of the auto industry, were no more fiercely loyal to their favorite manufacturers than are computer owners.

It is from the development work of the hobbyists that many consumer products have evolved—cars, radios, TV, hi-fi, stereo, and now the computer. Hopefully, the new friendly languages will be the development to make consumer products out of computers.

Turn your Apple[®] III into an Orchard

With software from Quark[™] Engineering

Quark Engineering brings you software specially designed for your Apple III. Easy-to-use products that dramatically increase your system's capabilities. And **your** productivity.

You start with Word Juggler[™], the most easy-to-use word processor available for the Apple III. Word Juggler is written in assembly language. And comes with special keyboard templates to label important functions.

Word Juggler retails for \$295. Form letter and simple mailing list capabilities are included free. If you want even more capacity, you can interface with Apple's Mail List Manager for an additional \$35.

Need to check your spelling? Add Lexicheck[™]. A high-performance spelling checker with a 25,000-word dictionary. You can add your own words. And get more accurate documents, without a lot of proofreading. The price? Less than a penny a word. Only \$195.

You can even send text from Word Juggler to computerized typesetting equipment. All you need is TypeFace[™]. Interface software which cuts your typesetting costs and eliminates re-keying errors. \$175.

Finally, there's TranScribe[™]. A spooler designed especially for hard disk drives. TranScribe lets you use other computer functions while you're printing. And it's compatible with most Apple III software. \$125.

There's much more to tell you about Word Juggler, Lexicheck, TypeFace and TranScribe. See them at your local dealer. Or contact us today. We'll help you turn your Apple III into an orchard. And from then on, you'll find easy picking.

CIRCLE 291 ON READER SERVICE CARD

A Maze Muncher for TI

Robert W. Cashman

creative computing SOFTWARE PROFILE

Name: Munch Man
Type: Arcade game
System: TI-99/4 or TI-99/4A
Format: Command Module
Summary: Excellent
Price: \$39.95
Manufacturer:
Texas Instruments Inc.
P.O. Box 53
Lubbock, TX 79408

Texas Instruments has developed a series of games for the 99/4 and 99/4A that rival those found in arcade centers. Their latest, *Munch Man*, is a perfect example. It is very similar although not identical, to Pac-Man, and the level of competition that *Munch Man* offers will give the seasoned player all he can handle.

The object of the game is to connect the passages of a maze with the continuous chain that your Munch Man leaves behind as a trail. For every link of the chain that is joined together, the player receives 10 points.

While you are trying to connect your chain together, however, four creatures called "Hoonos" are pursuing you. They are bent on gobbling you up before you can complete your mission. Each one has a different level of intelligence so you must be careful in out-maneuvering them.

Robert W. Cashman, 11 Hallenau Ave., Lawrence, MA 01841.

What can you do to combat this onslaught of creatures? You can locate and eat one of four energizers situated in the corners of the maze. You can't miss these. They look just like the state of Texas. The energizers give you the strength to capture the Hoonos and imprison them in the center of the maze.

You receive 70 points for eating an energizer and 100 for the first Hoono that you catch. Every subsequent Hoono captured doubles the number of points received from the previous capture.

How long can you remain energized? Not long. After a short period of time, the maze begins to flash from blue to red while the captured Hoonos escape. This indicates that your strength is returning to normal.

A player starts each game with three Munch Men, and the game ends, of course, when all of them are eaten. Should a player complete the chain while he still has Munch Men left, the game continues with an empty maze, four more energizers and four different Hoonos.

Munch Man can be played from the keyboard or with joysticks. Use the joysticks. They respond faster, and you will obtain much higher scores.

As is always the case with TI's Solid State Software Command Modules, a well written instruction manual is included.

As far as the quality of the game is concerned, the layout of the maze is terrific. It is three-dimensional and well thought out. Excellent graphics and some really imaginative sounds will keep you going for hours at a time.

I have two daughters and three nephews who are video addicts and range in age from six to fourteen; a better cross section of critics would be hard to find. These kids have played about 100 games on my 99/4 and no other has held their attention as long as this one. □

Eleven for the Apple in One Basket

Kamikaze

Mention Hayden Software and what does it bring to mind? Probably *Sargon* or a bunch of boring business packages. Well, along with a change in location from Rochelle Park, NJ to Lowell, MA, Hayden Software is making a change in product direction. *Kamikaze* is the first in a series of arcade games planned for release over the next six months.

creative computing SOFTWARE PROFILE

Name: Kamikaze
Type: Arcade game
System: 48K Apple, Disk Drive, Paddles
Format: Disk
Language: Machine
Summary: Tough challenge against a relentless enemy.
Price: \$34.95
Manufacturer:
 Hayden Software
 50 Essex St.
 Rochelle Park, NJ 07662

The theme is simple. You, the player, control a ship on patrol, presumably in the South China Sea. Paddle 0 controls the position of the ship from left to right on the screen. Your enemy takes the form of two torpedo planes flying overhead, one from left to right and the other from right to left at two different altitudes. They constantly drop torpedoes (or bombs) on your patrol boat. At your disposal you have a missile launcher (controlled by the paddle button) with which you can launch high speed surface-to-air missiles against your relentless enemy. But don't take time to congratulate yourself for shooting down a plane because a new one takes its place virtually immediately.

Shooting the high flying plane is worth 50 points whereas the lower flying plane is worth 25 points. You have five ships to start. For each 1000 points accumulated, you earn an extra ship. However, earning 1000 points also brings you face to face with the fearless (and foolish) Kamikaze pilots. Rather than fly from side to side, these insane pilots swoop down from the top of the screen, changing course as you do, ever heading toward your vulnerable patrol boat. Your missiles are effective against the Kamikaze planes, but in order to use them you must get under the plane first. It's not easy! Indeed, it's nearly

Kamikaze.

impossible. Not that you will have to worry about it very often! Reaching 1000 points is anything but easy.

We found one possible strategy was to linger near the right side of the screen, get into sort of a rhythm to hit the lower flying green plane on each pass from the left side. On the other hand, this yields only 25 points per hit so it takes far longer to amass 1000 points. Another successful strategy employed by one of the members of our playing panel was to maneuver toward the center of the screen which subjects you to more enemy fire but also affords you the opportunity of hitting one or both planes.

Although *Kamikaze* has only one central theme with no variations that we were able to discern, our panelists found it

Step right up! It's new,
it's fun, it's aMAZing!
It's WAYOUT, a game
so exciting it can
make a blind man talk,
a deaf man see!
Step right up and
put on these wayout
protective goggles.
Good! Now take
this compass and
mapmaker and step
inside this hallway.
Excellent! OK now, I'm
gonna lock you inside
and see if you can
find your WAYOUT!

See those fireflies?
They'll show ya which
way the wind is comin'
from — if you don't
get blown over first.
Oh, and beware the
Cleptangle. He loves
to sneak off with your
mapmaker and com-
pass. Whadya think?
Pretty WAYOUT, eh?

Yes, people
everywhere are going
out of their way to
play WAYOUT from
Sirius. The first
3-dimensional maze
game of its kind with
26 different adventures
to lose yourself in.
WAYOUT requires an
Apple II or II+
Computer with 48K
and one Apple disk
drive and is playable
with keyboard,
Apple-compatible
paddles or joystick or
with an Atari-type
joystick attached to a
Sirius Joyport.

Apple Games, continued...

quite challenging, some to the point of frustration. Nevertheless, we applaud Hayden for entering the exciting field of arcade games.

Rear Guard

Rear Guard is loosely based on the arcade game, *Defender*. In it, you are flying a spaceship from left to right across the screen (actually the ground and other objects are scrolling from right to left giving the illusion of flight). In the game, it's you against an armada of alien ships of different types. Five ships come at you from the right and are worth between 25 and 200 points. A freighter flies in the same direction as you (left to right) and is worth 300 points. In addition, a satellite identified by an F on its side that later changes to an S flies by. Hitting the satellite while it displays an F gives you a fuel recharge, while hitting it with an S gives you a shield recharge. The level of your fuel and shields is shown at the top of the screen along with the score and the number of LGG's remaining.

LGG's? Yep. The object of the game is to survive by preventing the ground-based LGG's (Little Green Guys) from collecting the orange energy pods that are dropped by destroyed alien fighters. These pods are vital because they can be traded in at the end of each game level for fuel, shields and/or bonus points. If you are like me, and constantly run out of fuel, you will want to trade your pods for additional fuel. The players on our panel tried different strategies, but whatever strategy you employ, the important thing is to eliminate the LGG's. This is done by swooping down close to the surface of the planet and shooting them as they speed by from left to right. The danger, of course, is swooping too low and hitting the surface of the planet, and missing out

Rear Guard.

on a passing fuel or shield satellite.

Although it is theoretically possible to play the game with the keyboard or paddles, we felt that to maintain your sanity, a joystick was necessary. In summary, *Rear Guard* is a fast-moving, colorful game that brings *Defender* home to the Apple. The game saves the top ten scores and player names, a thoughtful touch that we applaud. Also thoughtful is the policy of Adventure International to furnish a backup disk at the cost of \$3.99.

Fly Wars

Looking at the *Fly Wars* package, one can't help but be taken by the marvelous 3-D graphic effect. The software jacket is printed on a plastic card with narrow vertical stripes in which you see a different picture depending upon the angle of viewing. In this case, the title, *Fly Wars*, flits around like a pesky fly. You can almost hear the buzzing.

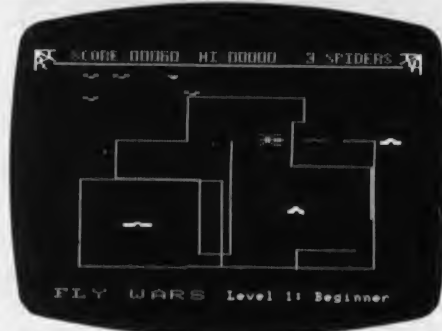

Our temptation is to relate new Apple arcade-type games to their coin-op counterpart in the arcades. Okay, so this relates to *Qix* and *Amidar*, but that is being unfair! *Fly Wars* is different and quite original.

In the game, you are a spider. You are

able to leave an etch-a-sketch type of trail on the screen; up, down, right, and left are the directions you may move and leave your trail. The flies flit about the screen from left to right and right to left. Your object is to trap these flies in an enclosed space which can "loosely" be thought of as your web. Each fly you trap is worth 20 points.

Trap a fly, gobble him up and, lo-and-behold, a caterpillar appears. Devour this little creature and he leaves a colorful cocoon at the bottom of the screen. Head down quickly, and push the cocoon from the bottom of your web to the top and you get a 200-point bonus.

At the beginning skill level, 200 points is enough to advance you to Level 2. Level 3 begins at 800 points and the next five levels begin at 800 point increments. But beware, it's not easy to reach them. Increasingly, you'll find showers of bug spray coming after you. Unlike nasty aliens, in shoot-'em-up games, the bug spray can't be eliminated; your only defense is to avoid it.

Fly Wars.

As you enlarge your web, the screen becomes crowded and empty space for trapping new insects is scarce. When this happens, you can "turn off" the web with your joystick button or the "P" key and simply crawl off the right or left edge of the screen to a new play area.

Fly Wars can be played with an Atari-type joystick connected to a Sirius Joyport. If you have five fingers which reliably do what your brain asks them to do, you can play *Fly Wars* from the keyboard.

If you want an exercise in unbelievable frustration, try playing *Fly Wars* with a paddle. Different points in the rotation correspond to different directions of spider movement. Sirius Software claims that some people like this method of control. We haven't found any (although, I confess, I have not visited Greystone Park, our local psychiatric hospital recently).

Seriously folks, *Fly Wars* is wonderful fun, but if you really want to be serious about it, you ought to have a Sirius Joyport to use as your electronic fly-swatter.

Procyon Warrior

This disk contains two games, the first of which is *Procyon Warrior*. The scenario makes you the commander of a space station which is under attack from planet earth. You have two weapons with which to defend your space station: small plasma bombs (useful against drones) and a remote controlled neutrino missile that is effective against the modest ship. The instructions tell us that "You will have only one neutrino missile available for use against each attacking fleet, so make it count."

Sound different? It is and it isn't. It's different in that you have two weapons on the screen at once, one controlled by paddle 0, and the other by paddle 1. From there on, the differences end. Each ship can move from side to side across the bottom of the screen. The smaller weapon can fire repeatedly although only two bombs may be on the screen at one time. As the instructions say, the larger missile must be saved for the attacking mother ship and must be aimed with care. In the first wave of attackers, there are three drone ships before the mother ship appears. On higher waves, there are more drone ships before the mother ship makes her appearance.

If you can anchor your paddles to the table top, you may be able to play this game single-handedly. Frankly, our playing panel found the only reasonable way to play was in teams of two, with one player firing the small plasma bombs and the other keeping the neutrino missile out of the way until the mother ship appeared. Even with this strategy, however, we found that the somewhat erratic motion of the drone ships made high scores as much a matter of chance as skill. Indeed, one team of players after scores of games, did not achieve as high a score as they did on their second game

Procyon Warrior.

when they were simply "feeling their way around the controls."

In the second game on the disk, *Appointment at Aldebran*, you must navigate through a field of asteroids and space pirates toward your home planet. You have a shield which affords you some measure of protection from collisions with asteroids and blasts from the space pirates, however, you'll have better luck if you attempt to avoid such collisions. In addition, you have 15 missiles which may be fired at the space pirates.

We found a joystick necessary to play this game. With it, it was a relatively simple matter to navigate through the asteroid field, though getting the space pirates was something else entirely! Two or three was usually the best we could do.

If shooting the space pirates was difficult, landing on the planet was nearly impossible. If you approach at too steep an angle you burn up in the atmosphere, whereas a shallow approach causes your ship to skip off into deep space and become lost. As the instructions say, "you must follow the fine line just short of overheating." Unfortunately, we never found it.

Jellyfish

The instructions tell us that, "your submarine, Dogstar, is on a dangerous mission to recover several discarded nuclear waste capsules from the ocean floor. The Dogstar has been equipped with a special mechanical arm for this purpose. It has also been outfitted with plenty of torpedoes used to blast belligerent Jellyfish, octopuses, and squid that seem intent on cutting your mission short. While torpedoing the sea creatures will rack up points, it also causes these underwater wonders to break up into smaller units that keep coming at you."

Jellyfish may be played with either the keyboard, Apple paddles (or joystick), or Atari-type joystick through a Sirius Joyport. We found these three modes of play quite different. The keyboard mode uses four keys that are adjacent to one another for up, down, left, and right movement as

well as for lowering the mechanical arm and firing. Since *Jellyfish* can be played by either one or two players there is one cluster of five control keys on the left and another on the right side of the keyboard, one for each player. While this particular method of controlling the submarines was relatively straightforward, most of our players were not particularly keen about it.

But if they were less than enthusiastic about keyboard control, they were downright hostile about Apple paddles or joystick control. The method of control is most unusual: rotating the paddle or pushing the joystick a different distance will move the submarine up, down, right, and left in a clockwise or counter-clockwise direction. This was a totally alien feeling and none of our players ever got the hang of it.

On the other hand, everyone agreed that an Atari-type joystick used with the Sirius Joyport provided natural movement and control, i.e., when you move the joystick left, the submarine moves left and so on. We don't see why a similar pattern of control could not be provided for a standard Apple joystick. However, as we have commented once before, that does not sell Joyports. Lest we be accused of cynicism, on with the evaluation.

All of our players agreed that the game was great fun when played with Atari-type joysticks through Sirius Joyport. Furthermore, most of them agreed that the two-player version was more fun than playing the game solo.

With two players, many offensive and defensive strategies can be employed. For example, when a player's torpedo destroys a jellyfish or other sea creature, it splits into many fragments which float up toward the surface of the water. These fragments are lethal to a submarine. Hence, after your torpedo hits a sea creature it is vital to get out of the way

Be your own chartmaker.

All it takes is GrafTalk™ and a little plain English.

We think GrafTalk is one of the most ingenious programs to come along since the birth of the microcomputer.

It turns out graphic designs, and text, so easily you can do it on your first try. And you don't have to be a computer expert.

Pie charts, bar charts, symbol and mixed charts, all accomplished on your desktop computer through a few simple instructions in plain English, all printed out on your printer.

No more handing over your figures to others. Then waiting around to see how the charts come out. Then waiting again. For revisions. And no more design expenses.

Further, in a bigger sense, GrafTalk helps you know your business better. For it lets you visually plot everything that's happening—share of market, quality control, sales trends, name it and you have it.

Not just when you have the time or budget. But anytime. GrafTalk puts it all at your fingertips. In color. Or in black and white. Depending on your equipment.

We sell and distribute GrafTalk worldwide,

along with more than 200 other programs, all usable with most microcomputers on the market. We are, by a wide margin, the world's biggest single source of micro and minicomputer software—with offices in the U.K., Switzerland, West Germany, Sweden, France and Japan. And a nationwide Technical Hot Line that you can depend on.

Just give us a call at (212) 860-0300. Or fill out the coupon.

Jellyfish.

quickly. On the other hand, if you can hit a sea creature which is immediately under your opponent, it is generally a sure-fire method of destroying him.

Since the sea creatures attempt to follow a submarine around, another popular strategy is to lure some sea creatures in the direction of your opponent while he is attempting to collect the discarded nuclear waste capsules from the ocean floor. During the collection process, submarines are particularly vulnerable as they cannot shoot and they move at a less-than-normal speed. Attacking your opponent in this way is also likely to cause him to be careless in picking up the capsule which can be disastrous. In particular, if you fail to line up the mechanical pick-up arm correctly, your ship will break open the capsule and you will be destroyed by the deadly nuclear waste.

Jellyfish provides three levels of responsiveness of the submarines and eight skill levels, more than enough for the most fanatic and dedicated players.

The game is great fun and a marvelous diversion from the more-or-less standard space ship shoot-'em-ups and *Pac-Man* offspring.

In short order, *Jellyfish* became one of the all-time favorites of our playing panel.

Oil Rig

We read in the instructions that "*Oil Rig* combines the strategy requirements of a board game with the fast action of an arcade game. Your strategy is to gain enough money through the oil products market to be able to afford the costs of prospecting, oil rigs, and drilling rigs. You also need enough cash to carry you through should you not hit oil."

The display on the screen at all times shows six oil products and eight pieces of equipment along with the quantity that you own, the current value (or price) and your total investment in that particular item. Prices of all of these items change month by month along with your cash, income, and net worth. Initially when you fire up the game, you will be alarmed by the speed of the price changes. The cursor relentlessly plows from the top to the bottom of the screen changing each of the fourteen prices in turn. As soon as one month is completed, the process starts over.

Price changes are affected by three

separate variables:

1) Market factors. These are general trends in the market that affect items on the master board. For example, an OPEC price increase would force oil market prices up while off-season travel would cause a general decrease in prices.

2) Individual traits. Each item on the board has a growth rate unique to that item. This may be in the same direction or counter to the overall market.

3) Inflation-deflation. A general trend either up or down is quite distinct from either of the other factors.

At the beginning of the game you select how many years you wish to play from 10 to 40; the longer the game the easier it is. You also select the level of difficulty from 1 (novice) through 9 (pro).

After bootup, the game immediately starts and you must be ready to make some quick decisions. Since you start with just \$1000 of cash and no equipment or product (gasoline, crude oil, etc.) these decisions are relatively simple. In particular you must buy some product so that you can sell it later on.

Oil Rig.

Since you must scan 14 items rather hurriedly, I initially adopted a rather simple playing convention, which was to buy products when their value was a single digit and to buy equipment when its value was under \$300, assuming I had enough money. In general, this got me going (although not always!). Then I could start keeping an eye on whether prices were going up or down.

I also found it easier to buy in multiples of 10 or 100. By so doing I could check my total value to the left against the individual value of items in the center column and, at a glance, tell if I could easily make money by selling or if I was behind. Multiples other than 1, 10, or 100 I found nearly impossible to check fast enough in my head to make intelligent sell decisions.

Be sure to read the instructions under the heading "Prospecting" carefully. The instructions admonish you to remember the location from which your core sample was taken (such as 18-12). The first few times I went prospecting, I was so excited that I forgot to remember from where my sample was taken and, when I returned to drill later on, I sunk a dry hole. Also,

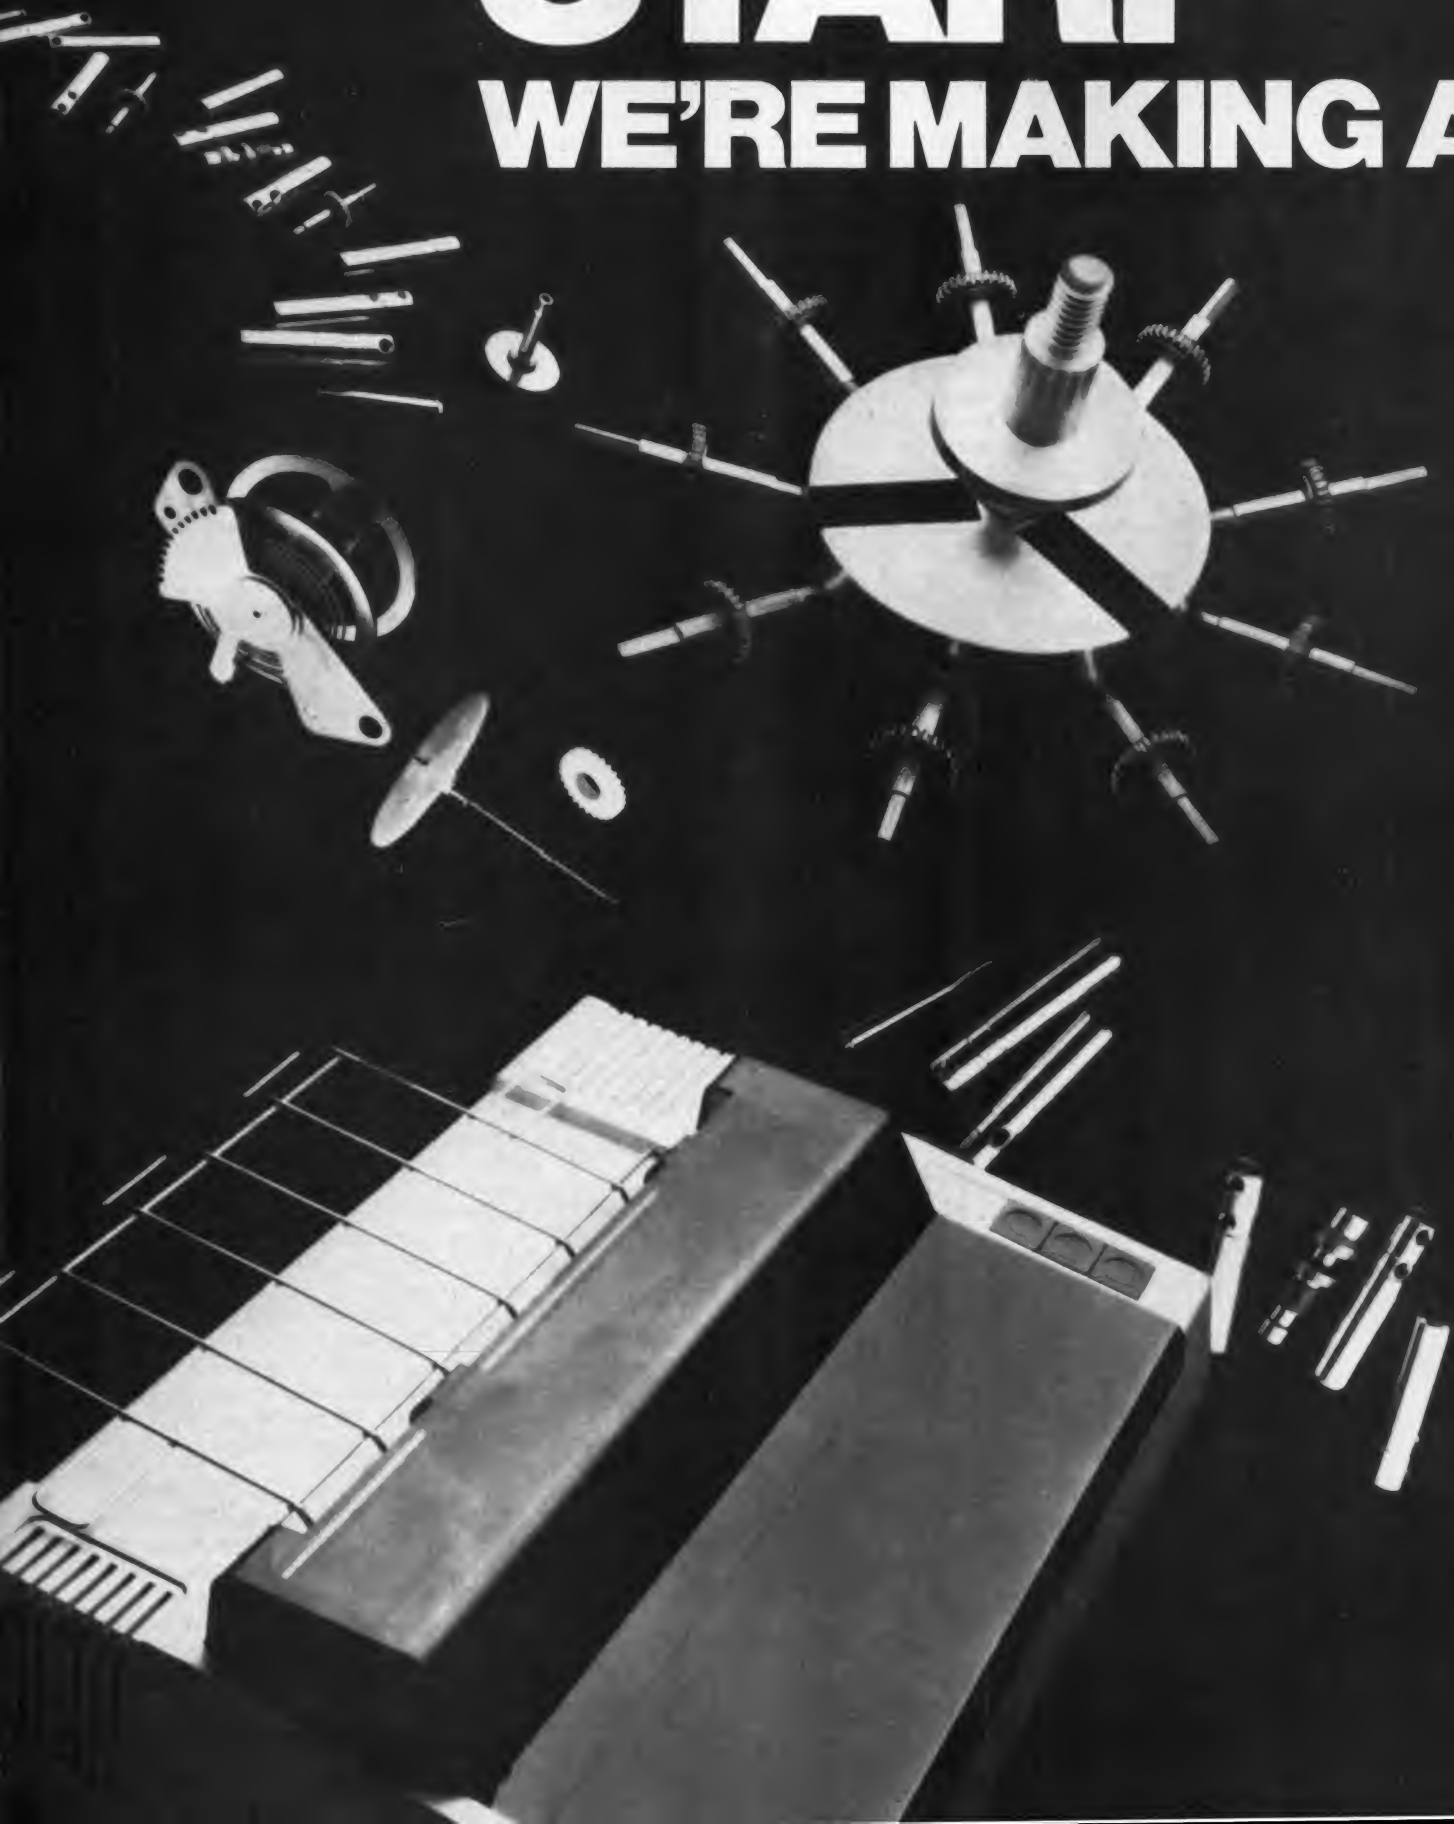

Campbell

"Hello, I'm a space invader... a real space invader."

STAR.

WE'RE MAKING A

NAME FOR OURSELVES.

**Building a reputation
for quality printers
of astronomical value,
from components on up.**

Making a name for ourselves in printers is only natural when we've been making the highest quality precision parts for over 30 years. And although Star's reputation in microperipherals has only begun to grow, the watch and camera industries worldwide

have been relying on Star components for nearly 3 decades.

Quality manufacturing is what we're building our reputation on. Star is a true manufacturer, not merely an assembler. We even design and manufacture the computer controlled machines that make our parts. With unlimited production capabilities, Star's factories can operate 365 days a year, 24 hours a day, producing more than 100 million parts a month. It is this kind of productivity and total quality control that assures you of get-

ting the very finest printer for the very lowest price.

And the best product for less is what you can depend on getting from Star. Star offers you a full line of reliable printers, printers with divergent technologies to meet your specific needs. And there's more. You get a low cost, high quality printer with a wide spectrum of interfaces to choose from—backed by Star's superior service network, there if you need it.

Star. We're going to be the quality printer you can count on, from components on up. And that's no pie in the sky promise.

MAKING A NAME FOR OURSELVES

200 PARK AVENUE, NY, NY 10166

CIRCLE 277 ON READER SERVICE CARD

Apple Games, continued...

beware of drilling too soon! You'll need a reserve of at least \$8-10,000 for sinking a hole.

As you get deeper into the game, you'll find you are spending more and more money. Be sure to heed the instruction that advises keeping at least \$20,000 but not more than \$100,000 cash on hand (to avoid being taxed to death).

Don't be discouraged if the first half dozen or even dozen times that you play you quickly go bankrupt. I did. But eventually I got the hang of it. Then I convinced myself that I was playing with someone else's money and really got into the swing of things. No, I'm not ready to take on Exxon or even Brock Petroleum, but I sure had a good time trying to get into C.P.U. Software's Tycoon Club in which they will refund the cost of the disk if you hit a gusher on your final score. I never did, but I had fun trying.

Star Base Gunner

The instructions tell us that *Star Base Gunner* "is a 3-D type game where you will be shooting into the screen at enemy ships located mathematically a great distance behind the screen." In other words, ships that are further away appear to be smaller and appear to move more slowly. In the lower levels of play (there are ten levels), you have a range finder. Using the joystick, all you have to do is line up the target ship between two horizontal marks on the side of the screen and below an arrow on the top. When the target is lined up, you may use one of three weapons: a laser beam (fired by button 1), a photon torpedo (fired by button 0), or a neutrino pulsar (fired by the Escape key). This third weapon may not be fired until you have achieved a score of over 2000. On the lower levels, the rangefinder will automatically shoot your weapon the correct distance.

Summary: Easy to play, nice 3-D graphics effects

Price: \$29.95

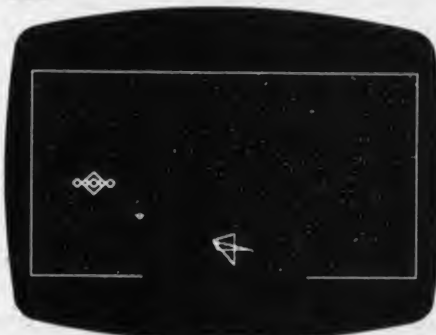

Manufacturer: Apple-Jack Software
P.O. Box 269
Auburn, MA 01501

Your goal is to keep your three solar arrays two energy storage units behind each array intact. They are the source of your power, so should they suffer damage, you will run out of power and the game is over. You are protected as long as your shield power is above 200.

As the game progresses you may find it necessary to put energy in the shields from your weapons system. This is done with the right arrow key. You may also get energy from the shields with the left arrow key.

While the instructions tell us that it is possible to play with paddle controls, we found that a non-centering joystick was vastly preferable.

The instructions spend many paragraphs talking about depth and perception relating it to the size of the target and the angular position of the gun site. While this was all very interesting, we found there was nothing like three or four rounds of play to get a good feel for the game. Once we did, we had no trouble progressing up through the lower levels. But eventually, kaboom! we got wiped out.

Star Base Gunner.

We found it curious that once we had aimed and fired our weapon the target obligingly stood still waiting for either a hit or miss. In most games, you have to anticipate where a target is going to be when your weapon hits and fire at that spot. However, in *Star Base Gunner* you simply have to get the target between your gun sights, fire and, if you were accurate in your sighting, you will get a hit. (This is reminiscent of the *Star Wars* game written by Bob Bishop, oh, so many years ago and now available on Apple Games Pak from *Creative Computing Software*. We can't help but feel that if joysticks were widely available three or four years ago, that *Star Wars* would have been one of the most popular arcade games of all time. As it was, perhaps it was too much and too soon).

Although *Star Base Gunner* was an interesting game, we think that it is probably a far better demonstration of the excellent Designer Graphics System by Apple Jack Software than it is a game in its own right. On the other hand, if you are looking for an up-to-date version of

Star Wars with color and sound, perhaps this is your cup of tea.

Neptune

In *Neptune*, you are the Commander-In-Chief of the naval vessel, Neptune. Your mission is to seek and destroy enemy robot amphibians that have inhabited neutral waters.

Although you are commanding a submarine and the theme is nautical, *Neptune*, in reality, is another version of the arcade game, *Defenders*.

Your submarine is traveling from left to right (actually the underwater terrain is scrolling by from right to left). As you travel along, small purple robots bounce from the top to the bottom of the screen and back again. In addition, cute little white faces with large red bow-ties bob about on the ocean floor.

Purple robots may be shot with your laser beam while the bobbing creatures must be trapped with depth charges dropped on top of them. After going through a group of these nasties, you come upon some "flying" saucer type of underwater vessels moving rapidly from right to left. These can be either avoided or shot (for 80 points each).

You then encounter a large cave (no nasty creatures). Unfortunately there is only one way through the cave and you must choose it long before you can see whether it is the right one. A little ESP, or just plain guess work is helpful here.

Following this, you enter a narrow cave containing vessels that cannot be shot. Here, you need quick reflexes and peripheral vision to see what's coming on the screen from the right both in terrain and enemy vessels as you stay toward the left center of the screen.

Get through the cave, and you can finally dock at your fuel station. Whew! Move your ship downward and to the

It's Here! The Computer Strategy Game with Bounce!

For:
Apple
Atari
TRS-80

Have you ever seen a fast action game combined with the intense strategy of chess, backgammon or Othello? Ricochet... the first abstract strategy game designed **exclusively** for the computer owner...is both. And loads of fun!

You and your opponent each have six opposing blocks to maneuver and two launchers to fire. Your shots ricochet off the blocks, changing their position with every hit, while earning you points on the way to their targets. The longer your shot ricochets, the more points you get.

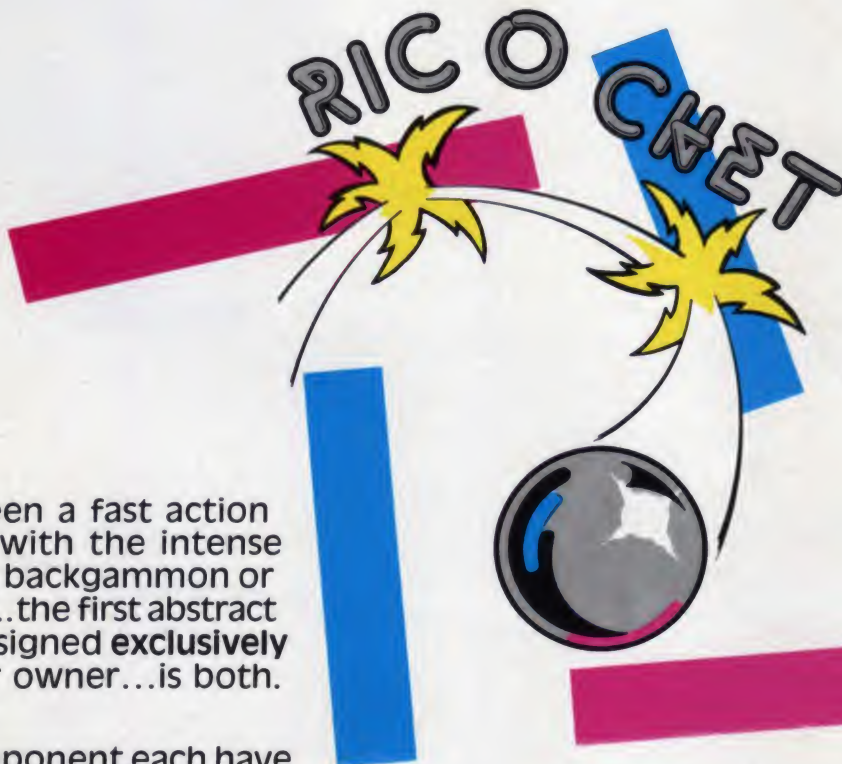

You don't have to play alone, either. Play against any of four different computer opponents, (each a different personality), or another human. Five game variants to choose from—each requires a different strategy.

Ricochet is truly competitive...if you want it to be. A "smart clock" lets you

put more pressure on your opponent by forcing him to play faster than you. But you've got to win two out of three (or three out of five) games to claim victory.

Your computer rates you after each match, so you can compare your mastery of the game with that of other players. In the long run, you're trying to rack up points for your personal Ricochet Rating.

Get Ricochet now at your local dealer for your Atari, Apple or TRS-80. Suggested retail price: \$19.95.

* APPLE, ATARI and TRS-80 are trademarks of Apple Computer, Inc., Atari, Inc. and Tandy Corp., respectively.

FRANKLIN **ACE** 1000

THE BEST DEAL IN TOWN!

THE FRANKLIN **ACE**1000

You just can't beat an ACE. Especially the Franklin ACE 1000. It's the professional personal computer with all the trump cards—it costs less, it includes 64K of RAM, upper and lower case, a numeric pad and VisiCalc® keys, all features not found on the Apple® II.

Peripherals that work with the Apple II will work with the Franklin ACE 1000. Programs that run on the Apple will run on the ACE. Totally Apple compatible . . . yet, so much more!

The Franklin Ace 1000—price, power, quality, reliability—the best deal in town. Call or write today for the name of your local authorized Franklin dealer.

CIRCLE 169 ON READER SERVICE CARD

WHO ARE YOU THIS TIME?

Are you the seeker of lost treasures in an enchanted realm of magical beings? Perhaps you're an astronaut, thousands of light years from earth, searching the galaxy's rim for the fabulous treasures and advanced technologies of a long-dead civilization. Maybe you're the plunderer of ancient pyramids in a maddeningly dangerous land of crumbling ruins and trackless desert wastes.

Imagine.

You wish to soar to other worlds, to behold wonders never beheld by mortal eyes, to dream unrestrained to the furthest limits of your imagination.

Imagine now that you can.

The ADVENTURE SERIES by Scott Adams has been reviewed by every major microcomputing magazine, receiving only the highest praise for its mind-puzzling challenge & refreshing originality. Tens of thousands of adults and children have matched wits with the Adventure Master. Now, it's your turn. If you crave the challenge and panorama of the exotic, touched with sparkling humor, then the Adventure Series is for you.

With the incredible Adventure Series by Scott Adams,
**YOU ARE WHOMEVER YOU WANT TO BE,
WHENEVER YOU WANT TO BE!**

Neptune.

right, and you're on way to a higher level, which is characterized by less maneuverability, changes in the underwater environment and aquatic life, and a faster pace.

The high score after each boot-up is saved, but high scores are not saved to the disk. All the members of our playing panel strongly preferred the joystick option. Incidentally, you will need a joystick with two quick fire buttons; the Apple Peripherals division (formerly the Keyboard Company) joystick just won't do for this game.

In summary, *Neptune* employs the spectacular graphics and excellence of execution that we've come to expect from Nasir in his years of producing games for Sirius Software. There's no question, that *Neptune* has all the makings of another big winner!

Bandits

Although nestled in a corner booth at the West Coast Computer Faire, Sirius Software was drawing huge crowds of people to watch the play of a new arcade game. They had a full-sized video arcade game, the interior of which had been gutted and replaced with an Apple computer and color monitor. In addition, the game play was being shown on a large-screen projection TV set. The game they picked to show—*Bandits*. The effort was

worth it; the game created quite a sensation!

Now, away from the hoopla, our playing panel has had a chance to evaluate *Bandits* in the comfort of our game room. The verdict: sensational!

At the start of play, you have a group of five items (fruits, vegetables, etc.) clustered at the right side of the screen. Alien bandits then come in and assemble at the left side of the screen outside the reach of your laser cannon. After they have assembled, they take off in various formations, flying and swooping about the screen, raining bombs upon your base at the bottom and making for your goods at the right.

At your disposal, you have a laser cannon which can blast the aliens into smithereens and you have shields which can protect you from their bombs.

Bandits has 28 levels of play; each level has a different group of items on the right and features a different combination of bandits that go after your goods.

You score 100 points for each supply item remaining after obliterating all of the bandits in an attacking wave. For each level you advance, you pick up an additional 100 points for each remaining supply item (maximum 500). If the bandits steal all of your supplies, the game is over.

You begin with five ships and are awarded a bonus ship for each 5000 points.

Shields are a mixed blessing. While they provide total protection against bandit fire or bombs, you only have a limited amount of shield energy. Shield energy is totally replenished with each new ship and slowly replenished during sustained play when the shields are not in use.

The variety of attack formations and aliens is staggering. Indeed, they cannot all be stored in memory at one time; thus,

Bandits.

the disk must be kept in the drive so that each attacking formation can be loaded as play proceeds.

The game may be played from the keyboard which uses the right and left arrow keys for movement, space bar for firing, and "S" for shields. We found this the least satisfactory method of play. Far better was a paddle or joystick with the knob (or stick) for movement, button 0 for firing, and the space bar for shields. Even better, was a switch-type (Atari) joystick attached to a Sirius Joyport. Joystick movement controls the base, while the button fires your laser and a forward tilt of the joystick activates the shield. We don't see why this movement convention could not have been offered with a standard joystick, but, cynically we observe that doing so would not sell Joyports. We also longed for a continuous fire feature, similar to the *Centipede* arcade game or its Apple look-a-like, *Photar*.

The high score of *Bandits* is saved each time the disk is booted up, however, it is not permanently recorded. We wish it were along with the player initials.

Nevertheless, despite these criticisms, we found *Bandits* great fun. If you are looking for nonstop action, look no further: this will give you your fill.

Quadrant 6112

In this easily played and rather nifty game, you navigate a little starship around a small sector of the galaxy defending your turf against nasty aliens. Your quadrant, 6112, is shaped like a rectangle just about the size of a TV screen. What a surprise! Now comes the real surprise. This isn't just another version of an arcade game; it is original!

Located in the middle of your quadrant, are two smaller squares of which the sides, one or two at a time, show only intermittently. These square boxes are actually star gates (or is it the other way around?) from which alien vessels eventually emerge to occupy your quadrant. Your mission, of course, is to blast them to smithereens.

At your disposal, you have the usual

creative computing

Apple Games, continued...

laser cannon in the pointed nose of your ship (fired with paddle button 0) and a "heat seeker" that will destroy every enemy that is in normal space. This is activated by pressing the space bar. The temptation is to press the heat seeker when there are many enemy ships on the screen, however, those that are still within the confines of the star gates are not affected by the heat seekers, hence it is wise to wait until a good number have emerged from these protective enclosures.

Control of your ship is the easiest we've seen in any game. Knob 0 controls the ship direction, short jabs on paddle button 0 fire your laser cannon, while holding down paddle button 0 activates your thrusters. It's simple and reliable. The only thing you must remember is that it takes time for your thrusters to change your direction because, like any object, your ship has inertia. In other words, once you have built up speed in a particular direction, you will continue to move in that direction no matter what direction your ship faces.

In addition to getting points for shooting alien ships, you also get points for navigating around the quadrant. Each time you go to a corner, a small red cross lights up and, when you have scouted all four corners, you score a "lap," which is indicated in a counter at the top of the screen. When you have eliminated the current assault, you receive extra points for each lap completed.

If you complete at least one lap in each of four different attack groups, you are awarded a bonus ship. The number of ships you have left is displayed on the screen at all times.

Every so often the alien commander will emerge to see who has been destroying his ships. Beware! He is a very good shot and extremely fast! Fortunately, he does not stay around for long.

SOFTWARE PROFILE

Name: Quadrant 6112

Type: Arcade game

System: 48K Apple, Disk drive, Paddles

Format: Disk

Language: Machine language

Summary: Fast moving, easy-to-play

Price: \$34.95

Manufacturer:

Sensible Software Inc.
6619 Perham Dr., Dept. G
West Bloomfield, MI 48033

Quadrant 6112.

A thoughtful touch by the author is storing the top ten scores and players names permanently on the disk. We wish more program authors would follow his lead. All in all, *Quadrant 6112* is a fast-moving, easy-to-play game that all of our panelists found good fun.

Lazer Silk

Lazer Silk is an amazingly imaginative game, in which you are a spider defending your web from annoying bugs and deadly insects. To keep your web from being torn apart, you must bundle (capture) bugs as soon as they fly into your web and land. To do this, you must get close enough to touch them. However, certain enemy bugs will not allow themselves to be bundled and, if you touch them, you will be immediately wiped out. Against them, you must use your own deadly weapon, *Lazer Silk*, to shoot them as they bombard you.

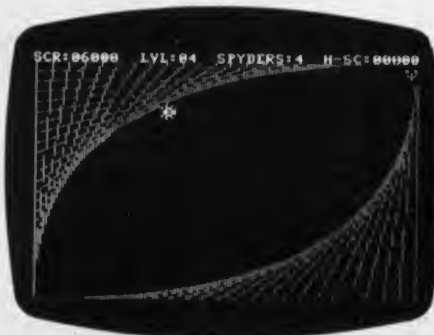

In addition, there are scavenger ants and beetles which scamper around your web and try to steal the bundles for which you have fought so hard. These creatures too may be bundled, but you must reach them quickly.

Another menace is the quick and unexpected electrode which darts around your web, chasing you until either it catches you or you shoot it. In addition, attack spiders occasionally drop from the top to the bottom of the web; against them there is no defense except to get out of the way.

The web is rectangular with a giant ellipse stretching from corner to corner missing from the center (see illustration). You can travel on any strand of the web which effectively permits you to go up and down, side to side, and diagonally. The game may be played from either the keyboard or a joystick. We found the joystick option far more satisfactory than the keyboard.

We found it took two or three plays of the game to get to know the different bugs on sight. After all, you don't want to go around trying to bundle a bee when it will sting you causing you to lose a life. On the other hand, it is easy to bundle a Xenar mystery bug, but you get 500 points if you shoot it instead. Once you memorize a few of the basics, then it's off to the business of spidering.

On earlier levels, the game seems rather tame and it's generally easy to bundle all of the bugs that land in your web. However, on later levels, you may well find yourself in one corner bundling a medfly when a scavenger ant appears in the diagonally opposite corner and steals two or three of your previously hard-earned

Lazer Silk.

bundles. This is bad not only because you lose your bundles but because it leaves holes in your web over which you cannot travel.

All in all, *Lazer Silk* is a clever, imaginative game; it was especially well liked by the girls on our playing panel. Even so, *Lazer Silk* tended to be less frustrating and last longer than most other arcade-type games, a fact appreciated by younger players. □

GOOD NEWS

Have you put aside buying a color monitor because it's too expensive? But, have you looked at the new TAXAN RGBvision color monitor? Would you be excited at a suggested retail price of \$399.00 for the RGBvision I, and \$599 for the RGBvision II?

DO WE HAVE GOOD NEWS FOR YOU!

For those low prices, you can have:

- ✓ Full compatibility with Apple III and IBM PC without interface modules
- ✓ Compatible with Apple II through the TAXAN "RGB-II" card
- ✓ RGBvision I medium resolution - 380(H) lines
- ✓ RGBvision II high resolution - 510(H) lines
- ✓ Unlimited colors through linear amplifier video circuit and 16 colors for Apple III and IBM PC
- ✓ 12-inch, 90° deflection CRT display

Can you really afford to turn all that down without looking at the TAXAN RGBvision monitors? See your local dealer for a demonstration.

TAXAN 12" green phosphor monitor, model KGI2N, features an 800 line resolution at center, 2000 character display

Dungeons and Asteroids

David Small

Warlock's Revenge

creative computing SOFTWARE PROFILE

Name: Warlock's Revenge

Type: Adventure with Hi-Res screens

System: Atari 400/800

Format: Cassette or disk

Language: Basic and machine

Summary: A good adventure game

Price: \$34.95

Manufacturer:

Synergistic Software
5221 120th Ave. SE
Bellevue, WA 98006

Warlock's Revenge is an Atari translation of an Apple game, *Oldorf's Revenge*. It is another graphics adventure and seems well done. I didn't encounter any bugs in my playing of it, and I had a good time, although I have to admit I'm beginning to burn out on generic adventure games.

After a certain point, you see, I get tired of trying to figure out which implement I must use to get past a certain point. The game becomes boring, and settles into mere combination testing.

While *Warlock's Revenge* suffers from this malady to some extent, it isn't nearly as bad as some I have seen. It wins points for this; there's nothing worse than an unplayable, un-figure-outable adventure.

In this game, you are leading a party into a dungeon. You can be any of several different types of character (cleric, magician, and so on), each of which has special skills. These skills are needed to get past a certain point in the dungeon and to continue the adventure. Be prepared for a great deal of testing of combinations, or perhaps a short session of dumping the game database to the printer. Hint: the game is all *hardcoded*, with all pictures, etc., coded into the program.

The pictures are all done in graphics 8, the highest resolution mode the Atari has. They seem to have had a good amount of work put into them, and the only detractor is that in graphics 8 the Atari doesn't put out a solid line, it tends to candy-stripe and change colors. This is called *artifacting* and can be of use to a programmer who understands it; the folks who did *Warlock* didn't, I'm afraid, so you would do well to turn off the color on your TV.

The game itself is a fairly standard adventure, with pictures at each stop and two-word commands. It runs fast enough and is fun to play. I recommend it and had a good time playing it, even if (I must confess) I have yet to completely finish it. This one will take you more than a couple hours to do.

Artifacting can be of use to a programmer who understands it; the folks who did Warlock didn't.

In summary, while it may be "just another adventure," the game is a lot of fun and good to play. Don't let the fact that there is good competition for it worry you; just because there are several good games like it available, doesn't mean this one isn't worth getting. There aren't yet enough adventures on the market to swamp it completely, so if you're into such things, or if you would just like to give one a try, this is a good choice.

Every reviewer has to fight a tendency to be sarcastic when he discovers a game that just doesn't make it. The urge to make cutting comments can be overpowering. In this case I was going to award the Cray-1 Speed In Arcade Games Trophy for this game. But that isn't how I view the purpose of a review. I prefer to try to make constructive comments on games that aren't quite right in the hope that the author(s) will consider my opinions and suggestions and, perhaps, improve the game.

WHAT'S EATING YOUR APPLE?

It used to be that you could spend hours just trying to find out whether software or hardware was responsible for a problem in your computer system.

Now you can find the answer quickly and easily with APPLE-CILLIN II, a comprehensive diagnostic system that verifies more than two dozen hardware operations. In almost no time, APPLE-CILLIN II will identify a specific problem or give your hardware a clean bill of health.

APPLE-CILLIN II is written entirely in assembly language, boots from any slot, works with 13 or 16 sector drives, and requires 16k of RAM and one or more disk drives. And it now features linked tests, 6502 CPU test, printed results, and disk speed test—all for only \$49.95. Find out what's eating your Apple, with APPLE-CILLIN II.

Dungeons, continued...

Kayos

Creative computing

SOFTWARE PROFILE

Name: Kayos
Type: Arcade
System: Atari 400/800
Format: Cassette or disk
Language: Machine
Summary: Good if you have superhuman reflexes
Price: \$34.95
Manufacturer:
 Computer Magic Ltd.
 P.O. Box 2634
 Huntington Station, NY 11746

So we come to *Kayos*. You've guessed it—it doesn't make it. It is very well done technically. It runs faster than most, and obviously a great deal of work went into it. I have no complaint with it technically. However, its human interface isn't very good. It is simply too fast for people. Robots with emitter-coupled-logic reflexes might enjoy it, however.

Kayos.

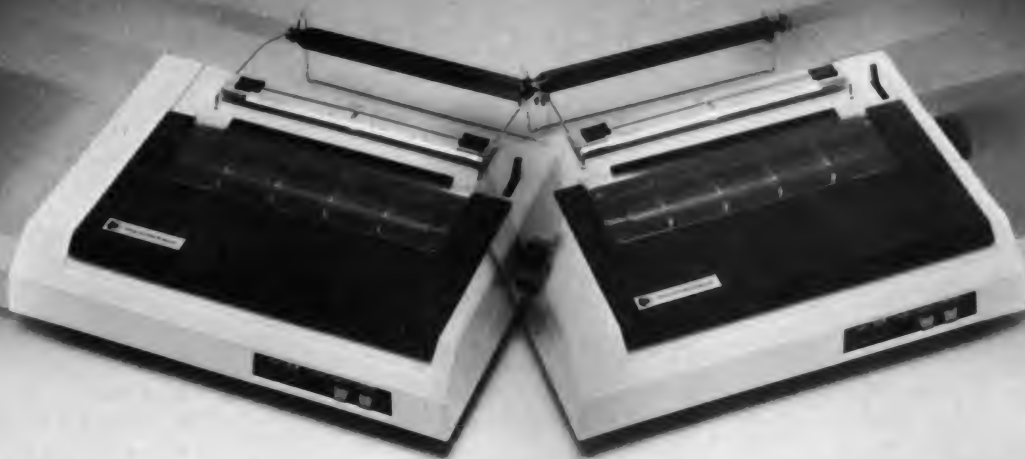

When you boot it up, you see a field of asteroids crossing space from left to right—a complex animation task for sure; someone worked very hard on it.

At blinding speed a series of blurry objects comes out of the top of the screen and dives upon your emplacement; I could never identify what they were, they went so fast. My average playing time was around a minute or two, and I just couldn't see spending too much time on the game.

Galaxians, and arcade games like it, are a challenge because they are not too fast. Much fiendish design effort went into making them just fast enough to be an agonizing challenge and not simply impossible. *Kayos* lacks this human engineering quality. It is a game sadly in need of a few strategically placed delay loops.

Look for a reissue soon, I hope. This could be a fun game if it were slowed to a playable speed. ☐

October 1982 • Creative Computing

PRINTS LIKE A DAISY...COSTS LIKE A MATRIX.

Integral Data Systems introduces the only low-cost dot matrix printer on the market that features Maisiey™ printing. Maisiey printing is a technique that allows you to produce correspondence-quality text approaching that of more expensive daisy-wheel printers, but at much faster speeds.

How fast? With Microprism Printer's™ dual speed capability, you can output at 75cps in correspondence-quality and 110cps in high-speed data mode. And it also features sharp, high-density graphics in an 84 x 84 dpi format.

You'll get cleaner, crisper output than you ever thought possible in a single pass.

Other standard features of the Microprism include proportional

spacing, text justification and, of course, software compatibility with our more expensive Prism Printer™ line.

The Microprism Printer is the perfect system mate that can handle all of your printing requirements... it's the best of both worlds. So if you've been waiting for the price of daisy-wheel printers to come down, or the quality of dot matrix to go up, now is the time to check out the exciting new Microprism Printer from Integral Data Systems.

Stop in at your local dealer today and ask for a demonstration. If you need the name of the dealer nearest you, call us toll-free at (800)258-1386.

Or write Integral Data Systems, Milford, NH 03055.

CIRCLE 181 ON READER SERVICE CARD

TRS-80 Arcade Games

Harry McCracken and Owen Linzmayer

Video game madness is sweeping America. News magazines publish cover stories on video games, bookstores sell books on how to beat them, and chart-topping records are recorded about them. It is not surprising, then, that many software publishers offer versions of the most popular arcade games for home computers.

Not surprising, at least, in the case of such computers as the Apple II, Atari, and TRS-80 Color Computer. Those machines all have high-resolution color graphics, sound routines in ROM, and paddles or joysticks. Not so the TRS-80 Model I and Model III. They have low-resolution black and white displays, no sound routines, and no game controllers. That is why it is remarkable that there are quite a few good arcade-style games for the TRS-80 Model I and III.

Let's look at four games which make especially good use of the limited potential of the TRS-80 as an arcade game machine.

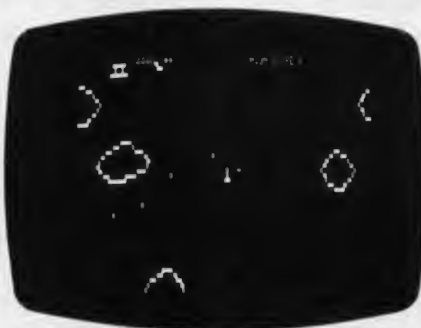

Planetoids

Planetoids, published by Adventure International, is, as the name suggests, inspired by the classic Atari arcade game

Harry McCracken, 47 Carleton Street, Newton, MA 02158.

Asteroids: you control a ship which shoots at floating asteroids and enemy spacecraft.

Adventure International has released versions of *Planetoids* for both the TRS-80 and the Apple II. Amazingly, the TRS-80 version is by far the better of the two.

Planetoids.

Greg Hassett, known primarily for his adventure games, has written one of the best arcade-style games available for any home computer with or without, high-resolution color graphics.

Many home computer games which try to simulate arcade games get the graphics of the original down, but *Planetoids* is one of the very few which do a good job of simulating the *timing* of the original. That means that playing *Planetoids* is much like playing *Asteroids*.

Planetoids is enhanced by its special features and playing modes. Like many

games, it has more than one skill level, but it also has the option of saving high scores to tape, the ability to abort a game in progress, and the ability to "freeze" a game, so that you can answer the phone and come back to an uninterrupted game.

The special modes include "dogfight" mode, in which there are no asteroids and you fight one-on-one with the enemy ships; "cruise" mode, in which the asteroids move very, very slowly, so that you can practice steering your ship; and "practice" mode, in which game play starts out at a higher skill level than normal—*Planetoids*—gets harder as you

YOUR PROGRAM HERE

The best software for the IBM Personal Computer. Could it be yours?

Attention, all programmers. Here's a chance to reach the top.

If you've written software that's completed and runs on the IBM Personal Computer, we could be interested in publishing it.

(We also could be interested if it runs on *another* computer. If we select your software, we'll ask you to adapt it to our system.)

But be advised.

Our expectations are great.

Because the software we publish must be good enough to complement IBM Personal Computer hardware. In fact, the more you take advantage of all our hardware capabilities (see the box at right), the more interested in your software we become.

Think about incorporating color graphics into your program, for example.

Use sound. Consider the power of our keyboard and remember to utilize the ten programmable function keys.

In all cases, we're interested in "friendly" software—with emphasis on quality and wide appeal. Programs with the greatest chance of being published must be easy to use, offer a better way to accomplish a task and provide something special to the user.

What kinds of programs? All kinds.

Education. Entertainment. Personal finance. Data management. Self improvement. Games. Communications. And yes, business.

We select programs that will make the IBM Personal Computer an even more useful tool for modern times.

play—and your score is not recorded on the high score chart.

All of these features ensure that *Planetoids* will hold your interest for a long time.

I do have two small complaints about the game. It does not have sound, and there is no two-player mode. Neither of these is a big problem, but the game would be better if it had sound and two-player capability, as most TRS-80 arcade games do.

Alien Defense

Another game which does a good job of adapting an arcade game to the TRS-80 is *Alien Defense* from Soft Sector Marketing. Inspired by Williams's arcade hit *Defender*, it is probably the most difficult arcade game around for the TRS-80.

As in *Defender*, you control a ship which flies above a horizontally scrolling landscape and shoot down many kinds of aliens, some of which fly down and kidnap people who stand on the landscape.

The graphics in this game aren't as

ships look more like alien ships than they do on the Model I. This is the only Model III game I know of which uses the Model III graphics so well.

All in all, *Defender* fans should be very pleased with *Alien Defense*. Like *Defender*, it is a very challenging game, so beginning arcade game players might find it a bit complicated at first.

Defense Command

creative computing

SOFTWARE PROFILE

Name: Defense Command

Type: Arcade game

System: TRS-80 Model I and III,
16K cassette, 32K disk

Format: Cassette or disk

Summary: Big Five's best yet

Price: \$15.95 cassette; \$19.95 disk

Manufacturer:

Big Five Software
Box 9078-185
Van Nuys, CA 91409

Big Five Software has released a steady stream of superb games, over the last couple of years. One of their most recent games, *Defense Command*, is their best yet. It might be described as *Space Invaders* crossed with *Defender*. You control a base at the bottom of the screen, *Space Invaders* style, and protect fuel cells from attacking aliens who try to steal them.

Just about everything which has distinguished Big Five games in the past is in *Defense Command*. Explosions are more realistic; the high score chart lets you type in your full name, rather than just a few characters; and the infamous Big Five Flagship is more evil than ever. Like *Robot Attack*, *Defense Command* talks through the tape port, but the speech is far clearer.

While *Defense Command* is a difficult game to master, it is not complicated; beginners may play terribly, but they will understand and enjoy the game. And because *Defense Command* requires more true strategy to master than the other Big Five games, even advanced arcade game enthusiasts will find it a challenge.

If you have trouble formulating a strategy to play the game well, watch the demonstration mode; the computer plays

the game very well, and it is easy to pick up pointers from watching it play itself.

Armored Patrol

In writing a TRS-80 version of an arcade game the biggest problem is usually the creation of an acceptable graphics display. This is a difficult task with almost any hi-res game (what current arcade game isn't hi-res?) but, when a TRS-80 version of a vector graphics game is desired, it borders on the impossible—or so I thought. *Armored Patrol* is an adaption of the popular arcade game *Battlezone*, which uses vector graphics.

Written by Wayne Westmoreland and Terry Gilman, *Armored Patrol* is an amazing demonstration of how far creative programming can stretch the limited graphics capabilities of the TRS-80. In *Armored Patrol* the player assumes the

good as those in *Planetoids*; they flicker and the movement is a bit too jerky. That isn't surprising, though; there is a great deal of movement going on in this game.

Larry Ashmun, the author of *Alien Defense*, has done a good job of putting the ship controls onto the TRS-80 keyboard. While you must manipulate six keys to control your ship, the pattern in which the keys are arranged makes it easy to do.

The Model III version of *Alien Defense* has an added feature: the special character set of that computer is used, so that the little men look like men, and the alien

28K Commodore VIC Personal Computer **\$299** (60% more powerful than VIC-20)

FOR THE SPECIAL SALE PRICE of \$299.00, you get the Commodore VIC-20 computer, plus we add 60% more programming power. This powerful full sized extra featured computer includes the 6502 microprocessor (LIKE APPLE), 20,000 bytes ROM with a 16K extended microsoft LEVEL 11 BASIC, 8000 bytes user RAM; plug in expandable to 32K RAM, 66 key typewriter professional keyboard with graphic symbols on keys, 16 colors with command keys, sound and music, real time, upper/lower case, full screen editing cursor, floating point decimal and trig functions, has high resolution graphics, 512 displayable characters, test display is 23 lines, 22 characters, will accept TAPE-DISK-PLUG IN CARTRIDGES. We have great games and many other programs. It has low cost, direct plug in peripherals, does not require an expensive interface board for modems, printers or floppy disks, connects to any TV, includes AC adapter, RF modulator, switch box, self teaching instruction book.

Arcade Games, continued...

which he can safely blast the enemy without risking destruction himself.

An enemy tank can combine forces with a killer robot to attack simultaneously from different vantage points. The player is aided by a radar scope that gives him a rough idea where the enemy is in relation to his position, but visual confirmation is usually required for accurate shooting.

Armored Patrol.

As the enemy tank approaches it grows in size and its surface details become clearer right up to the point where you are looking down the cannon barrel. By then it is usually too late to do anything but pray.

Armored Patrol is a classic in every sense of the word. Its value as a simulation is tremendous but it is also a superb arcade game. Although the controls are a bit difficult to master, it is a wonderful program for game players with even modest coordination. I recommend this package without reservation. — O. W. L.

The Puzzle Of The Tacoma Narrows Bridge Collapse: An Interactive Videodisc Program For Physics Instruction

Dean Zollman and Robert Fuller

On November 7, 1940 the bridge across the Tacoma Narrows went into violent oscillations and collapsed within a few hours (Figures 1-3). Most of the final hours of the bridge and many earlier oscillations were photographed on 16mm color film by Barney Elliott, proprietor of The Camera Shop in Tacoma, WA.

The films of the bridge undergoing oscillations with amplitudes of over two meters can motivate almost any student to learn more about wave motion. Several years ago one of our students paid the ultimate compliment to a short edited version of the original film: "I'd even pay to see that."

Thus, while this event was a disaster in terms of cost and hurt pride to engineers, it has provided physics teachers with the most captivating demonstration of wave phenomena ever devised. Certainly, physics teachers have long applauded the designing engineers for their contributions to physics instruction and Barney Elliot for filming it.

The quality and uniqueness of the Tacoma Narrows Bridge film make it very valuable for audio-visual presentations. When we and Thomas Campbell of Illinois Central College began thinking about subjects for our first interactive videodisc, the Tacoma Narrows Bridge and the reasons for its collapse were natural choices.

Further, several good physics films on wave motion and vibrations are available. By using them and Mr. Elliott's film we believed we could create a low-cost instructional videodisc. Thus, we proposed to the National Science Foundation (NSF) Directorate for Science Education that it support us in this low-cost approach to videodisc education. The NSF agreed to provide funds, so we began planning in early fall, 1979.

Dean Zollman, Department of Physics, Kansas State University, Manhattan, KS 66506.

Robert G. Fuller, Department of Physics, University of Nebraska-Lincoln, Lincoln, NE 68588.

Tacoma Bridge, continued...

The Bridge Disc

The Puzzle Of The Tacoma Narrows Bridge Collapse was created as a Level Two videodisc (see box) and is designed for use with a Pioneer PR-7820 videodisc player. Any student who learns physics by using the disc must interact frequently via the remote keypad.

This interaction takes the form of answering questions or making choices which are presented on the television screen. The degree to which the student is active during the lesson can be described in terms of its length. If played from beginning to end as one would a motion picture, the program lasts for slightly less than 27 minutes. When taking part in an interactive lesson, students spend from two to four hours using the system.

By using the programming capabilities of the player, parts of the program can be made available to some students but not others. We used this aspect of the technology to establish three levels of physics instruction.

These levels are labelled red, blue and green and correspond to the three major types of introductory physics courses—physics for the nonscience student, physics presented using algebra and physics using calculus. At various points during the lesson students branch to frames which depend on their level.

As we developed the disc we were guided by some basic principles. First, students should have a strong motivation to study the subject matter on the disc. Second, the physics involved should be presented as a problem or puzzle for the students to solve. They, not we, should be the ones to state "The bridge collapsed because..."

Finally, the interaction between disc and student should be much more than answering questions. By viewing pictures of real experiments they should be able to take data and draw conclusions from them. In summary, the lesson on the disc must be theirs not ours. While we provide the means by which they learn, they discover what they need to know to solve the problem.

With these thoughts in mind we divided The Puzzle Of The Tacoma Narrows Bridge Collapse into five parts: Introduction to the Player, The Bridge Collapse, The Influence of the Wind, The Importance of the Bridge Properties, and Conclusion. Perhaps the best way to see how students work with the disc is to take a guided tour of each part.

Introduction To The Player

We assume that students would not previously have used an interactive videodisc player, so our first step is to teach them how to use the system. They are

guided through a series of operations each of which teaches how to use a key or series of keys needed to interact with the disc.

The presentation requires action on the part of the student; the picture does not change, for example, unless he presses the appropriate key. By the time the student has finished this short section he has demonstrated sufficient knowledge of the system to complete the lesson.

The Hook

When the student reaches the end of the introduction to the player he is told to enter the number 49, then press RECALL SEARCH. These entries on the keypad recall from memory the frame number stored in memory location 49, then cause the machine to search to that frame.

The next picture states PRESS AUTO-STOP. When this key is pressed, the machine plays to the frame stored in the memory location which is one greater than the last one used. (In this case the disc plays to the frame stored in memory location 50.) This series of entries begins the physics lesson.

We have informally named this section of the disc "the hook" because it is used to pique the student's curiosity about the Tacoma Narrows Bridge and its collapse. It "hooks" or intrinsically motivates him to complete the study of standing waves which is recorded on the disc.

Here the student views the construction, initial oscillations, violent oscillations and collapse of the first Tacoma Narrows Bridge. Accompanying the video is an audio narration created from written

accounts of Professor F. B. Fahquarson, a consulting engineer, Kenneth Arkin, chairman of the Tacoma Narrows Bridge Authority; and Leonard Coatsworth, a reporter for the Tacoma News-Tribune and the last person to drive onto the bridge.

We feel that this seven-minute sequence will hook even the least interested student into wanting to learn more about the reasons for the bridge collapse.

After the bridge has collapsed and Mr. Coatsworth has lamented the loss of his daughter's dog Tubby (the only casualty), the videodisc stops on a frame containing the question "Why did the Tacoma Narrows Bridge Collapse?"

We do not answer that question directly. Instead, it is posed so that the student is presented with a puzzle to be solved. During the next two to four hours of study he will discover the pieces that can be put together to help explain this disaster. With some help from a video disc he will solve the puzzle of the Tacoma Narrows Bridge collapse.

The Influence Of The Wind

So far in the lesson the student has been rather passive. He has watched the bridge collapse but has done little else. That situation changes quickly.

To learn about the influence of the wind on the bridge collapse the student must take control of a series of experiments. The experiments involve a model of the bridge, a fan and a piece of cardboard. The fan blows on the bridge with three different speeds. In addition to a constant push, winds can blow in such a

Nearly 600 pages of information.

Publisher's Price \$36.50

CIARCIA'S CIRCUIT CELLAR: Volumes I and II.

The two softbound volumes provide... a complete tutorial to the construction of over 30 microcomputer projects.

Volume I includes:

- how to build a dual voltage converter, and various methods to help you achieve voltage multiplication
- classical I/O decoding and memory mapped methods
- how to construct an 8 channel $3\frac{1}{2}$ digit DC digital voltmeter interface

Volume II includes:

- how to build a computer controlled security system for your home
- a design for a computer controlled wood stove
- how to add nonvolatile memory to your computer

Publisher's Price \$20.95.

The Library of Computer and Information Sciences is the oldest and largest book club especially designed for the computer professional. In the incredibly fast-moving world of data processing, where up-to-date knowledge is essential, we make it easy for you to keep totally informed on all areas of the information sciences. In addition, books are offered at discounts up to 30% off publishers' prices.

Begin enjoying the club's benefits today!

4 Good Reasons to Join

1. The Finest Books. Of the hundreds of books submitted to us each year, only the very finest are selected and offered. Moreover, our books are always of equal quality to publishers' editions, never economy editions.

2. Big Savings. In addition to getting the Personal Computing Library for \$2.95 when you join, you keep saving substantially—up to 30% and occasionally even more. (For example, your total savings as a trial member—including this introductory offer—can easily be over 50%. That's like getting every other book free!).

3. Bonus Books. Also, you will immediately become eligible to participate in our Bonus Book Plan, with savings up to 70% off the publishers' prices.

4. Convenient Service. At 3-4 week intervals (16 times per year) you will receive the Book Club News, describing the Main Selection and Alternate Selections, together with a dated reply card. If you want the Main Selection do nothing and it will be sent to you automatically. If you prefer another selection, or no book at all, simply indicate your choice on the card, and return it by the date specified. You will have at least 10 days to decide. If, because of late mail delivery of the News, you should receive a book you do not want, we guarantee return postage.

If reply card has been removed, please write: **The Library of Computer and Information Sciences**, Dept. 7-BE5, Riverside, N.J. 08075, to obtain membership information and application.

Tacoma Bridge, continued...

way as to create a pulsating force on bridges.

In this experiment the pulsations are created by periodically placing the cardboard in front of the fan. The fan can be set to three different speeds. The pulsing action results in no pulses, low frequency pulses, and high frequency pulses. With three values for each of two variables, nine different experiments exist. Each of these experiments has been recorded on the videodisc.

P U L S E S	S P E E D S		
	Low	Medium	High
None	70	72	74
Medium frequency	76	78	80
High frequency	82	84	86

ENTER NUMBER/RECALL/SEARCH
TO EXIT: 88/RECALL/SEARCH

The student is introduced to the experiments and told that he must use them to determine what aspect of the wind was important in the collapse. Then a choice matrix (Figure 4) appears on the screen.

The present Tacoma Narrows Bridge has four lanes instead of two. Thus, its Linear Density is about twice that of the collapsed bridge.

STP FWD

Enter the location of the bridge with the higher frequency.

211 Collapsed Tacoma Bridge
212 Present Tacoma Bridge

Then press RECALL/SEARCH

By pressing appropriate keys the student may select the experiments he wishes to see.

When he decides he has seen enough, he may end the experiment and move on. But, he cannot go far until he has been tested on his conclusions. A series of multiple choice questions query him about the influence of the wind. Incorrect answers cause the machine to show the experiments again. The student is stuck until he reaches the conclusion that the rate of pulsation, not the speed of wind, is the critical factor.

The Bridge Properties

Pulsating forces arising from wind cause most bridges to vibrate, but the

first Tacoma Narrows Bridge fell down. To understand the difference between this bridge and most others, the student moves on to investigate the properties of vibrations in general and of vibrating bridges in particular.

To complete the investigation the student must have some knowledge of the physics of waves and oscillations. He learns this through a series of short presentations which rely heavily on a computer animated film created by Encyclopedia Britannica Education Corporation with the assistance of Professor Albert Baez.

These sequences, which require some interaction by the student, lead up to a

Capabilities Of The Optical Videodisc

This optical videodisc system offers a new level of capability to the instructional designer. Each side of a disc can contain about 50,000 individual pictures (usually called frames). These frames can be shown one at a time for as long as needed; they can be played at regular speed (30 frames per second) to show normal motion; or they can be played at any slow motion speed forward or backward.

At normal playing speed the videodisc can play one or both of two audio channels. The audio capabilities allow for stereo sound, bilingual education, or different narratives for students with different backgrounds. While all of these features are useful, they would be of limited value without random access.

In a very short time an optical videodisc player can select and play any frame on the disc. For a well-constructed disc the search time is less than a second. For the worst possible situation, a search from frame one to frame 50,000, the access time varies from a few seconds for the educational-industrial models to about twenty seconds for a consumer player.

An interactive videodisc can be created at several different levels of instruction. At Level One the disc is designed for use on a stand-alone consumer model player such as the Pioneer VP-1000. Most discs at this level are motion pictures which play from beginning to end without any interaction. However, consumer players such as the Pioneer VP-1000 and VP-1100 have all the capabilities described above. Interactive discs can be and have been created for it. Perhaps, the best and most interactive to date is *The First National Kidisc* produced by Bruce Seth Green. (A review of this disc appears in the January, 1982, issue of *Creative Computing*).

A Level Two disc requires a small microprocessor such as the ones built into the Pioneer PR-7820 (formerly called the DiscoVision PR-7820) and the Sony LDP-1000. These players have internal memories which allow the instructor to enter program steps or to load the numbers of significant frames. While the various players have slightly different capabilities, they are all approximately equivalent to a 1K microcomputer.

Generally, a digital program is placed on the second audio track at the beginning of the disc. This program is loaded into the memory of the system and controls the operation of the disc. To date large numbers of videodiscs at this level of interaction have been created by General Motors and Ford. Many auto showrooms have stand-alone players with keypads for interaction. The *Puzzle Of The Tacoma Narrows Bridge Collapse* is designed for this type of interaction.

The third level involves coupling the videodisc player to an external computer. At present the most frequently used computers are the personal variety. All Pioneer players and the Sony are capable of receiving information from a computer. Thus, highly interactive lessons using all the advantages of both systems are now available.

The economics lesson developed by the Minnesota Educational Computing Consortium and described in the January, 1982 issue of *Creative Computing* is an example of this type of disc. A Level One disc can also be converted to a Level Three disc as was demonstrated by the computer-video adventure game published in the same issue of *Creative Computing*—D.Z.

SAVVYTM

... the **PERSONAL LANGUAGETM** system
that mirrors your commands using
your own words!

What SAVVY is —

- SAVVY is a miraculous new information handling system.
- SAVVY is an automatic database management system.

What SAVVY does —

Through SAVVY, you and your computer talk to each other in your own natural, conversational English (or Spanish, or French, etc.).

It learns from you what you want done in your own personal language. Once SAVVY learns your language it can create any file you wish. Input, output, additions, changes and deletions are arranged for you.

SAVVY's "Robot Programmer" has been trained to write 100% of the programs needed to manage your database information.

SAVVY runs on CP/MTM and Apple DOS.

What YOU discover —

You'll discover that SAVVY recognizes your personal words, even if misspelled, or even if you use a phrase never used before!

SAVVY continues to grow through use to become better and better at understanding your commands.

Eventually, you will see SAVVY as a mirror to your own way of thinking and working. It is a re-definition of "user-friendly".

SAVVY, it's the first system that truly means "personal computing".

SAVVY is like no other system on earth.

SAVVY cost \$950.

Seeing is believing. SAVVY is on display at selected computer retail locations. Call for the name of your nearest dealer.

CP/M is a trademark of Digital Research Corp.

Apple is a Trademark of Apple Computer Inc.

MARKETING INTERNATIONAL

Welcome to the world of User/Friendly Computing

Software should be easy to use, easy to understand and forgiving when the user makes an incorrect entry.

You don't have to know how to use a computer to use Micro Lab products. The programs are designed to be **error-trapped** and made to get the job done.

Wall Streeter

This portfolio management program allows you to enter, by hand or modem, Friday's closing prices, Standard and Poor, Beta ratings, Value line timeliness and safety factors. Use standard formula or make up your own to project buys, sells and holds.

Asset Manager

Both old and new tax laws are incorporated in this program which uses the straight line method for balance sheets and accelerated method for establishing asset values for amortization and prints tax schedules. 1,000 assets per taxpayer.

The Data Factory

An extremely easy-to-use system with enormous power and flexibility. Data storage on two disks is 225,000 bytes. Relocate records into a new data base; add, delete, or change field lengths anytime.

V Factory

Allows for a marriage between Data Factory and VisiCalc™ files. You can move data in either direction, manipulate it within the chosen program, and store it either way. An exciting tool for research and analysis.

Relocatable Linking Loader

Takes machine language routines that have been designated by an assembler as relocatable, links them together, and then establishes the program at an address the user specifies. Can be used with Language Plus.

The Invoice Factory

Not just an invoice maker. It generates statements, aged receivable reports, product or customer reports, sales analyses. Use a new free form, automatic or standard invoice form.

Tax Manager

For producing federal income taxes and printing the schedules. This easy-to-use program includes the latest tax laws and will remain current with our Extended Warranty option.

Payroll-Manager

A whole department that doesn't write itself a check. Figures hours and makes all standard deductions plus seven optional deductions and writes the checks. Unbelievably fast, and easy to use.

The Learning System

A company or educator may prepare a training/tutoring/testing device. Enter instruction or information; then key it to a tutorial drill or test to check for learning comprehension.

Data Manager III

A data base designed for the Apple III and can be used with floppies or hard disk drive. It will handle as many records as the storage media can handle with total flexibility.

Language Plus

A two volume library of machine language routines. These packages allow users, through Applesoft Basic, to speed up their performance in programming.

Merger

A utility for the Data Factory and Invoice Factory. Merge data from fields in either program into those of another file.

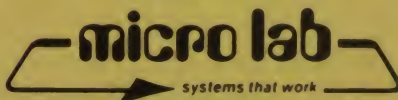

V Blend

Allows users of VisiCalc™ to combine data in multiple VisiCalc™ files, merging the information into a new file.

Entertainment

Test your luck and skill with exciting games from Micro Fun.

Tacoma Bridge, continued...

series of experiments with vibrating ropes. These ropes are placed under different tensions, have different lengths, and have different masses per unit length (linear densities in the language of physics). Experiments for three values of each variable are recorded on the disc.

The student is asked to determine how each variable affects the frequency of vibration for the rope. Exactly what conclusions he is to reach and how he is to do so depend on the instructional level—red, green, or blue. For example, the red level student must use his data to derive an equation which describes how the frequency depends on the three variables, while the green level student must state how the frequency changes as each variable increases or decreases.

The videodisc is an excellent medium with which to present this experiment. In real time the motion of the ropes can be seen only as a blur. Using the slow motion capabilities of the disc, the motion is slowed to the point where the student can count individual vibrations. In addition, each frame on a disc is assigned a frame number. Since frames are shown in real time at a rate of 30 per second, the frame number provides a 1/30th second timer. Using slow motion and the frame number the student can collect data on vibrating ropes in a manner which is not practical in any other way.

Once the student has completed analyzing his data, he must answer questions about his conclusions. First, he is queried about vibrating ropes. Then, to help him see how his conclusions apply to bridges, he is presented with questions such as the green level question in Figure 5. When he has completed this section, the student is ready to put all the pieces of the puzzle together.

The Conclusion

The two major parts of the puzzle—the wind and the properties of the bridge—have been investigated separately. To bring them together, the interaction between the two must be studied. This part of the disc does that at the three levels of instruction.

The red level student looks at the mathematical relations governing the oscillations of the bridge. In doing so he learns that the motions can be divided into two parts—vertical and twisting (torsional). For the Tacoma Narrows Bridge he learns that the frequency of twisting motion and vertical motion were almost identical. Thus, when a part broke and allowed the destructive twisting motion to begin, it did so quickly.

The blue or red level student sees a segment about turbulence which builds up on the downstream side of a flat object in the wind. With animated diagrams such

as Figure 6 they learn how this turbulence can create pulsating forces on a bridge.

All three levels view other examples in which a pulsating force leads to periodic, and sometimes increasing, motion. A flag in the wind, a child on a swing and a bouncing ball are examples of similar physical phenomena.

As television inevitably does, instructional videodisc concludes with a TV commercial. Ella Fitzgerald (or was it Memorex?) displays one more example of a similar event—breaking a wine glass with sound.

Using The Disc

To date, a few hundred students have completed the lesson as described above. Most of them have learned the physics that we hoped they would. More important, they have become involved in the problem solving nature of the presentation. In this way they have learned a little about how science works and sharpened their own ability to look at new situations in a systematic way.

The Future

When we were developing the disc, we included material which would require computer control for full interaction. While the lesson does not require this material to solve the puzzle, it can be designed so that students have more control over what they see. Thus, a program to use the disc under computer control is under development. When that program is completed, we will have finished our work on this disc.

Our experiences with The Puzzle Of The Tacoma Narrows Bridge Collapse have encouraged us to continue developing videodiscs for physics instruction. One videodisc, Physics And Automobile Collisions, is complete but has not yet been used by students. Several others are in various stages of development. In each case we are constructing the discs so that students are presented with problems they must solve, and at least part of the solution involves taking data from videodisc. With this type of instruction we hope to increase students' abilities in physics and problem solving. At the same time we hope they have as much fun learning from videodiscs as we have producing them. □

The First Commercially Available Level Two Instructional Videodisc

What do you do with an interactive videodisc for physics instruction once it is completed. About a year ago we were faced with that problem. After showing it to our friends, relatives and professional colleagues, we looked for a commercial distributor.

At that time the only optical discs being distributed were motion pictures and a few others such as The First National Kidisc. The distributors of these discs were not interested in a disc with as limited an audience as high school and college physics teaching.

Fortunately, a major science textbook publisher, John Wiley & Sons, was interested in this new form of delivering physics instruction. In the spring of 1982 John Wiley began selling The Puzzle Of The Tacoma Narrows Bridge Collapse (\$125). Thus, this disc becomes the first Level Two disc to be available from a commercial source.

COTTAGE SOFTWARE

PACKER: Machine language program that edits all or part of your Basic program to run faster, save memory, or ease editing. The 5 options include UNPACK—unpacks multiple statement lines into single statements maintaining logic inserts spaces and rennumbers lines. SHORT—deletes unnecessary words, spaces, and REM statements. PACK—packs lines into maximum multiple statement lines, maintaining program logic. RENUM—rennumbers lines, including all branches. MOVE—moves line or blocks of lines to any new location in program. On 2 cassettes for 16K, 32K, & 48K. For TRS-80™ Mod I or III Level II or Disk Basic.....\$29.95

SYSTEM TAPE DUPLICATOR: Copy your SYSTEM format tapes. Includes verify routines. The Model III version allows use of both 500 and 1500 baud cassette speeds.

For TRS-80™ Model I or III Level II.....\$15.95

CASSETTE LABEL MAKER: A mini word processor to print cassette labels on a line printer. Includes 50 peel-and-stick labels on tractor feed paper.

For TRS-80™ Model I or III Level II & Printer.....\$17.95

PRINT TO LPRINT TO PRINT: Edits your Basic program in seconds to change all Prints to LPrints (except Print@ or Print#) or LPrints to Prints. Save edited version.

For TRS-80™ Model I or III Level II.....\$12.95

FAST SORTING ROUTINES: For use with Radio Shack's Accounts Receivable, Inventory Control I, and Disk Mailing List Systems for Model I Level II. Sorts in SECONDS! You'll be amazed at the time they can save. Supplied on data diskette with complete instructions.

FAST SORT for Accounts Receivable.....\$19.95

FAST SORT for Inventory Control I.....\$19.95

FAST SORT for Disk Mailing List (specify data diskette for 1 drive system).....\$14.95

TERRAPIN, THE TURTLE PEOPLE, NOW BRING YOU THE LOGO LANGUAGE FROM MIT.

In 1978 we introduced the Terrapin Turtle Robot. Once again, Terrapin takes the lead in educational computing, with our **Logo for the Apple II.**

HERE'S WHY YOU'LL "WIN" WITH TERRAPIN LOGO:

TERRAPIN LOGO'S UNIQUE FEATURES

- IT'S EASY TO USE: write graphics programs from the start (by using simple commands like Forward, Left, and Penup)
- USER-DEFINED PROCEDURES—create your own vocabulary of commands and use it to build complex programs
- Floating point and integer arithmetic
- Comes with FULLY-INTEGRATED SCREEN EDITOR, for programs and text
- Powerful programming tools (like Procedures, Recursion and Lists) encourage structured thinking
- Saves pictures to disk—print pictures INEXPENSIVELY
- Assembly language interface capability
- Available for NETWORKING SYSTEMS

EDUCATIONAL GUIDE PROGRAM

Developed by a staff of LOGO EXPERTS, including former members of the MIT Logo group.

- Beginners learn step-by-step with Terrapin Logo's TUTORIAL MANUAL
- SEMINARS for teachers and Apple-Users groups
- HOTLINE—instant access 617-492-8816 for solutions to any of your questions
- BOOKS on Logo and the Turtle Robot in education

Terrapin Logo is available at computer stores worldwide. For your nearest dealer call or write:

Terrapin, Inc.
380 Green St.
Cambridge, MA 02139

LOGO Ideas

Robert Lawler

Passing The Buck

Sometimes difficult problems can be simplified by doing a small part and "passing the buck." This example is to clarify the idea and the Logo techniques for applying it. Suppose you want to print messages in a code where every word is spelled backwards, e.g. sdrawkcab. How can you write a procedure to switch letters around? You know the procedure begins with a title line and a variable input, such as:

```
TO SWITCHEM :INPUT
```

If the input to SWITCHEM has no letters, nothing should be printed — maybe a space. If the input is only one letter long (such as "I" or "a"), it should be printed. If the input is longer, you will always want to print the last letter of the input anyway, so you might as well do that and pass the buck (all those other letters except the last one) to another procedure, call it HARDER:

```
TO SWITCHEM :INPUT
IF EMPTY? :INPUT PRINT SPACE STOP
TYPE LAST :INPUT
HARDER BUTLAST :INPUT
END
```

Now, what should the HARDER procedure be like?

If the input to SWITCHEM was one letter long, the input to HARDER will have no letters — it should stop. If HARDER's input is one letter long, that letter should be printed. If longer, you will want to print the last letter of the input anyway, so you might as well do that and pass the buck (all those other letters of HARDER's input except the last one) to another procedure — call it EVEN-HARDER.

Doesn't that sound familiar? EVEN-HARDER will have to do the job that HARDER was supposed to do. HARDER does the same thing as SWITCHEM. The good trick in passing the buck is *you never have to write the HARDER procedure* if SWITCHEM calls itself:

```
TO SWITCHEM :INPUT
IF EMPTY? :INPUT PRINT SPACE STOP
TYPE LAST :INPUT
SWITCHEM BUTLAST :INPUT
END
```

What Good Is Planning?

One view is that planning breaks a problem up into parts, each of which can be more simply solved than can the whole. For example, if you wanted the turtle to draw a picture of a

house, you probably would find it easier first to write a triangle procedure for the roof and a square for the storey then put the two together than you would composing a procedure for drawing the whole thing at once.

A richer view of planning is that the breaking up of a problem is very fruitful — because you will create partial solutions which can be used in different ways to make other things. Let's extend the HOUSE example. The simplest extension of a HOUSE would be to separate the parts from each other and reconnect them a different way. Doing so you could make a WISHINGWELL, such as the one drawn by this procedure:

```
TO WISHING.WELL
RIGHT 180 STOREY
RIGHT 180 FORWARD 100
ROOF
END
```

This attempt to use the parts of a HOUSE as parts of a WISHING-WELL runs into an immediate problem: the WISHING-WELL is bigger than the house. If you want both of them in the same picture, it will be necessary to make another triangle and square procedure for a small wishing-well. At this point, it makes sense to generalize the ROOF and STOREY sub-procedures, specifying their size by the use of input variables, as in the procedure below:

```
TO STOREY :SIDE
LEFT 90
FORWARD :SIDE/2
RIGHT 90 FORWARD :SIDE
RIGHT 90 FORWARD :SIDE
RIGHT 90 FORWARD :SIDE
RIGHT 90 FORWARD :SIDE/2
RIGHT 90
END
```

```
TO ROOF :SIDE
LEFT 90
FORWARD :SIDE/2
RIGHT 120 FORWARD :SIDE
RIGHT 120 FORWARD :SIDE
RIGHT 120 FORWARD :SIDE/2
RIGHT 90
END
```

Not only are these new procedures more flexible, the way they fit together can now be modified to make a better house than the original.

```
TO HOUSE.WITH.EAVES
RIGHT 180 STOREY 100
RIGHT 180 ROOF 120
END
```

What is Logo?

Molly Watt

Logo is a computer language which was developed to provide an environment which allows learning to take place as naturally as possible. Seymour Papert and his colleagues at Bolt Beranek and Newman and later at MIT set out to create a computer language which would combine the capabilities of artificial intelligence with the theories of Jean Piaget in order to allow a learner to build his own intellectual structures through estimation, interaction, experience and revision.

The Logo language is designed to provide an environment in which the child/learner is in charge of

- Setting a problem to solve.
- Making choices.
- Playing with the problem, experimenting and trying out solutions.
- Building on what he has already done to do something more.

The language is interactive. You learn it *at* the computer. After working with a problem for a while, you edit it, revise it, and then play your next steps.

With Logo, a young learner can enter directly into the world of turtle geometry. Without memorizing formulas, he can create procedures for drawing squares, triangles, and circles.

This is unlike my own experience in geometry. I learned geometry in high school only because I was required to take the course as preparation for college.

Geometric thinking is possible now for any learner without a series of prerequisites. At the Lamplighter School in Texas, three year olds have used Logo to

explore turtle geometry. And MIT students use the concepts of turtle geometry used in Logo as a way to explore mathematics.

Seymour Papert is often quoted as saying that "Logo has no threshold, no ceiling." I have heard it said that Logo is a six year old's dream and a computer scientist's nightmare. Logo makes complex explorations possible for learners of all ages, without imposing artificial hurdles.

With Logo, a young learner can enter directly into the world of turtle geometry.

How does a child explore turtle geometry? It is really quite simple. Every child knows how to move from one place to another. Using his own experience in walking, a child "teaches" the turtle to move across a computer monitor leaving a trail or line to create a drawing.

Let's call our learner Wendy. Her first experience might be something like this:

1. She decides to experiment by drawing a square.

2. She paces a square on the floor to notice how she draws it.

3. She remembers how she did it and types a set of commands to the turtle which might look like this:

FORWARD 25 (no, not far enough)
FORWARD 25 (okay, that's enough)

RIGHT 40 (oh, that wasn't what I meant at all, let's try more) RIGHT 40, (well that's not it, try again) RIGHT 10 (that's it) (let's see, what was it,) FORWARD 50
RIGHT 90

FORWARD 50
RIGHT 90

And so on until she has a square. With that accomplished, she can simplify the steps and teach the computer to do it by shifting to the edit mode. What shall the name of this procedure be?

Very often a student will name it with her own name, typing:

TO WENDY
FORWARD 50
RIGHT 90
FORWARD 50
RIGHT 90
FORWARD 50
RIGHT 90
FORWARD 50
END

The turtle will then "know" how to WENDY, and will execute a square every time the command WENDY is typed.

Now Wendy can enjoy playing with the procedure WENDY, and will probably type it over and over for the pleasure of watching the turtle "know" how to WENDY. The second WENDY will be drawn in a screen position which will surprise her, and our new Logo user will immediately type WENDY again just to see what happens. At the end of four

NEC's NEW ADVANCED PERSONAL COMPUTER GIVES CHARLIE THE BLUES.

If you're a businessman shopping for a personal computer, take a look at NEC. Our APC™ Advanced Personal Computer has better price/performance than any personal computer on the market.

It's a totally solutions-oriented system, supporting both CP/M-86™ and MS-DOS™, developed to solve business problems in the simplest, most cost-effective way possible.

Our business software has been optimized to take advantage of the APC's unique hardware features. That makes system operation faster and easier.

Our software includes a full set of general accounting packages, word processing, mailing list management, business planning, database management, and communications. And we're readying many more.

We back our software with a unique unconditional guarantee. It will work or you get your money back.

Our APC comes with more information storage capacity than any system in its price range.

Our high-resolution color graphics run circles, arcs and lines around everybody else. The APC's screen images—lines, characters, pictures—are unprecedented in their clarity.

See for yourself how much better we are. The solutions-oriented Advanced Personal Computer from NEC. Return the coupon to NEC Information Systems, Inc., 5 Militia Drive, Lexington, MA 02173.

HAYDEN

SOFTWARE

What Is Logo, continued...

WENDYS, there is a new design which can be taught to the computer as a procedure containing the subprocedure WENDY. It looks a bit like a window, so Wendy can type:

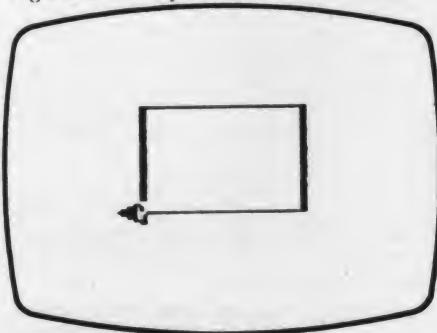

```
TO WINDOW
WENDY
WENDY
WENDY
WENDY
END
```

or

```
TO WINDOW
REPEAT 4 (WENDY)
END
```

Wendy has started the process of

Figure 1. Wendy.

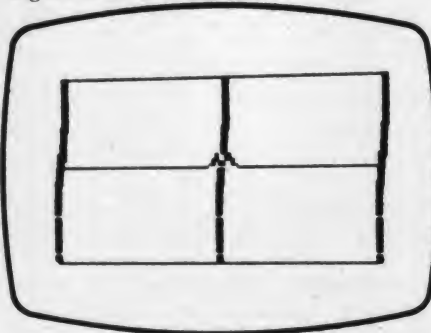

So it is with this first turtle drawing: Suddenly the Logo user is part of the world which assigns airplane reservations, cashes checks, and launches space shots. This is a world of power, which has in this first lesson become part of Wendy's own learning continuum. The process is intrinsically motivating and fascinating.

As every person can learn to use a pencil, everyone can — and will — learn to program a computer.

Projects by New Users

I think that it is important to look at some examples of tasks that some real students have set for themselves as problems to solve when beginning to learn Logo and to use a computer.

Figure 2. Window.

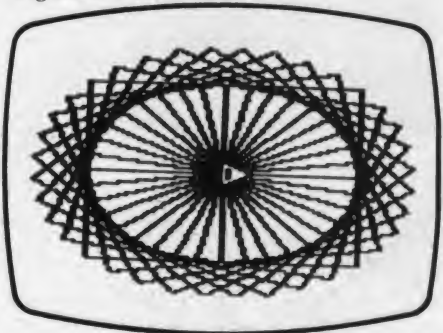

My purpose is to demonstrate the many working styles and interests which Logo can support. These students were in my classes in Amherst and Cambridge, MA and were between the ages of 8 and 17.

After several class sessions in a hands-on laboratory, I often suggest to my students, "See if you can make the turtle draw your initials." Many try the project, seem to enjoy the challenge, and then go on to some other experiment.

Two students, Ted and Stella, were working side by side, and became completely absorbed in drawing letters. Each determined to create a complete alphabet.

Ted immediately wrote a procedure to produce the whole alphabet, before creat-

Figure 3. Rosewindow.

- Learning to control the turtle.
- Using the computer as a tool.
- Teaching the computer to execute an original idea and naming it.
- Noting the steps she used in order to save them as a procedure.
- Using the procedure as a subprocedure in her second procedure.

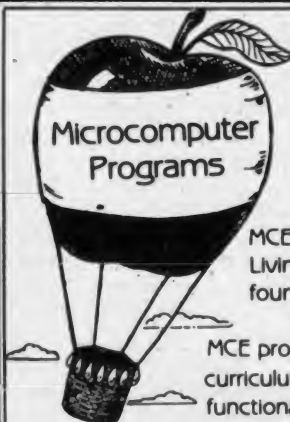

She has started to create her own computer language.

Taking the same example one step further, our new Logo user, in playing with WINDOW, may quickly discover that by using the procedure WINDOW and then rotating the turtle's position slightly a new design is made that holds a shape which begins to approximate a circle. This experiment can be formalized by typing, for example,

```
TO ROSEWINDOW
REPEAT 9 (WINDOW RIGHT 10)
END
```

As in all learning, the first job is to learn to control your tool. If you are using a pencil, you must practice holding it.

Your first written word may be your own name, which is a profound word to the writer. It permits you to show ownership, authorship, borrow library books, sign a check and send a greeting card through the mail. It is still a long jump to writing a dissertation or even applying for a job. However that one word puts you into the powerful world of words which make up magazines, recipes and phone books.

Above the Crowd

MCE offers you superior microcomputer programs in Basic Living Skills. These programs have been field tested and found effective.

MCE programs are sophisticated yet simple to use. They offer curriculum flexibility in special ed., voc. ed., home economics, functional math and consumer ed. among others.

Eighteen programs are available from \$44.95 for Apple II®. They feature: branching to individual reading and ability levels, a variety of instructional formats, vivid color graphics and advanced teacher control options.

To learn more about MCE programs call collect (616) 345-8681 or return the coupon below.

```

```
C
```

```
DRAW
```

```
.
```

```
.
```

```
.
```

```
END
```

A B C

Ted then began the long process of creating procedures to draw each letter in turn. After his alphabet was completed he was dissatisfied with the amount of time each letter was displayed on the screen. He began to work on the more complex programming problem of creating something for the computer to do invisibly so that the letter on the screen could continue to be displayed for a longer period. This was a natural extension of his alphabet procedure.

Stella started out to solve what appeared to be the same challenge as Ted's. During the process, she became fascinated

END

"FALSE is 1
"TRUE is 1
```

by the proportions of height and width and how a variable input could change the relationships represented graphically.

The qualities of the computer which allowed her to experiment with inputs and then provided her with an almost instant reformulation of her letters heightened her excitement as well as her understanding about one way a computer could extend her thinking.

She began to collect patterns for monograms and initials which might make interesting designs on stationery. Her classmates used her program to think about embroidering on denim. For her final project, Stella created an art show using Logo procedures.

In one of the first Logo classes, Mark and Suzy became a working team. Mark seemed to need to be admired for his programming prowess and Suzy was reluctant to touch the computer.

This combination worried me because it seemed to reproduce the stereotyped, and I believe harmful, pattern of the way men and women relate to technology.

This twosome often seemed to have private jokes and to direct gestures toward classmates. Although I felt uncomfortable and wondered whether I should intervene, their classmates paid them no attention.

In the meantime, I watched and thought about them whenever I had a second to spare from this demanding programming class. I was aware that none of my suggestions had been accepted by either of them. While Mark was actively executing his ideas, Suzy admired, and I waited.

Then one day the duo split, each needing a computer to work on.

Mark was inventing a clock. It was a digital clock. The person using his program could type in the hour, minute and second and could then watch time move in five-second increments. His ability to capture some essence of time was satisfying to him, and truly mystifying to his classmates. Mark told them that his program was simply an approximation of time as is the time that all clocks keep.

Listing 1 shows how his program looked after a solid week of programming.

Learn it in a **FLASH**

michael shrayer's

ELECTRIC

pencil

word processing system

- **Easy to Learn** – Like lightning you will be up and running with a comprehensive and sophisticated word processor. Our manual says you can be an expert in one hour, our users tell us it takes less than 30 minutes. The manual's 128 pages are packed with figures, illustrations and examples for the beginner and "old pro".
- **Easy to Use** – With the **ELECTRIC PENCIL** you process words, not commands. **ELECTRIC PENCIL**'s menus and simple two keystroke commands keeps your mind on your work, NOT on your manual. **ELECTRIC PENCIL** is so easy to use your secretary will WANT to use it... so sophisticated you'll be glad she did. David Ahl, the editor of Creative Computing says, "**ELECTRIC PENCIL 2.0** is the most user friendly word processing package available."
- **Features** – **ELECTRIC PENCIL** has a 36k+ text buffer (48k disk system), supports disk, tape and Stringy Floppy files (disk version)* and has every major feature you want in a word processor. It is "bullet proof" – Data recovery is a built-in feature. The exclusive **DICT-A-MATIC** feature gives your office the flexibility of dictation-word processing without fancy equipment. Your dictation playback is controlled from the computer keyboard.
- **Flexible** – It is the only word processing system that is designed like an operating system. You can add new programs and features to **ELECTRIC PENCIL**, such as **RED** and **BLUE PENCIL** dictionary/correction – with a 50,000 word dictionary (sold separately) – without patches and upgrades. Simply press one of the control key combinations and new additions to your system are instantly available. Add automatic proofing, spelling correction, dynamic print formatting, proportional printing, communications, graphics and typesetting and many other add-on features when you need them.
- **Versatile** – **ELECTRIC PENCIL** runs on TRS-80 model I and model III computers under all versions of TRSDOS, and NEWDOS without modification or patching (Patches required for other operating systems). It also supports parallel and serial printers as well as single and double density disk systems.

ELECTRIC PENCIL is the choice of thousands - make it yours for only \$89.95 (disk version) or \$79.95 (tape and Stringy Floppy versions). Manual only \$24.95.

ELECTRIC PENCIL is available at computer stores, selected B. Dalton Booksellers and selected independent book dealers. If your dealer is out of stock, order direct (specify disk tape or Stringy Floppy version). Include \$4.00 for shipping and handling. Foreign residents add \$11.00 plus purchase price, in U.S. funds.

*Tape and Stringy Floppy versions support tape and stringy files only

NEW LOW-COST ENGINEERING/BUSINESS PLOTTER

Cost-effective "originals"

The Model DXY is an economical multi-pen, X-Y coordinate plotter that produces hard copy graphics in minutes for all types of business applications and technical disciplines. Priced at under \$1000, it's compatible with the IBM, Apple and other personal computers. It has built-in software (expandable ROM) to interpret "Basic" commands. Just call, or write for complete specifications on the Model DXY Plotter. Ideal for end-user or OEM applications.

- 10" x 14" effective plotting range.
- Centronics interface for easy connection to your computer.
- Pens, penholders, chart hold-downs, and dust cover are included.
- Charts on popular graphics media including vellum and mylar.

CIRCLE 107 ON READER SERVICE CARD

What is Logo, continued...

His program does have some "bugs" which he has probably solved by now. One is the matter of conversion; the seconds do not convert to minutes after the number 60 is reached. This was not discouraging to Mark. This was the next part of his program which needed attention in order to make it work better.

On the other side of the classroom, Suzy sat at a computer alone. At first she seemed to me to be immersed in a science fiction book. As I moved nearer, I saw that she was using the science fiction book as a reference for her work. She was working with an intensity I had not seen previously.

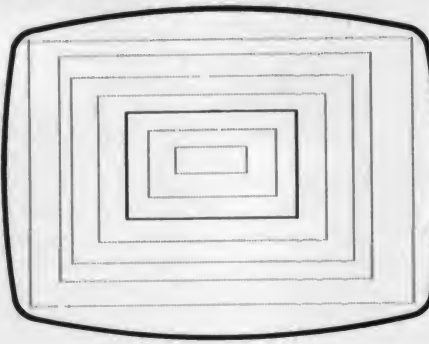

Between footstamps and fistshakes at the computer she was creating a science fiction book. She had discovered that the computer could print words. Linking her interest in reading science fiction with her limited knowledge of microcomputers, she had started on her first self-initiated project. She organized the procedures shown in Listing 2.

As the course ended, Suzy was beginning to experiment with turtle geometry to illustrate each chapter. My next steps for Suzy were to teach her how to save pictures drawn on the video screen, and to introduce her to the Logo text editor.

Suzy shared her project with her classmates during the last day of class. The science fiction aspect captured their imaginations, and they demonstrated genuine interest in her work.

With our visions of what is possible for a Logo user to accomplish, Suzy's example may not seem dramatic. I include it because I believe we often push students to

Figure 6. Door Through Time.

go too fast and forget the value of allowing a person to set his own goals. I do not believe that Suzy would have started sooner if I had structured the lessons differently; she needed a period of watching to get herself ready.

One visually oriented student spent many class periods creating drawings, saving his pictures directly on his disk without writing procedures. Jamie planned color and line relationships carefully and gave names which suggested to me the dimension of fantasy the computer offered him.

While classmates often gave pictures and procedures single letter names to avoid laborious typing, Jamie was content to take the time to type "Door Through Time," "Sparkle in the Night," "Experience in the Fifth Dimension," delighting classmates with his naming as much as with the pictures.

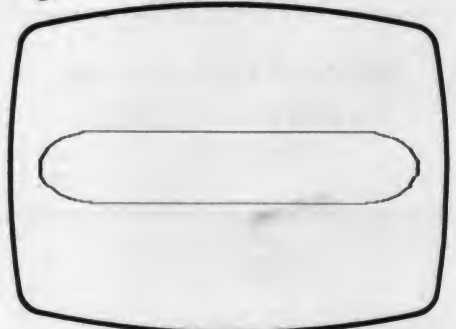

Another example of the way an individual entered the Logo environment or "mathland" is Jim. He simply started experimenting with the turtle.

He drew a shape which he later named "slot" because it looked like one. This slot with its circular ends and straight line connections intrigued him. During a series of lab periods, interrupted by several other projects, he progressed to "tslot" which added color and assumed a new position on the screen.

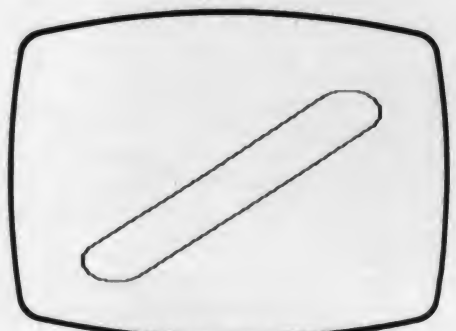

Next he played with variable inputs in order to experiment with size relationships. His moment of astonishment came when he discovered that the formula for a circle which he had memorized was approximate.

Jim was a serious student, and he often borrowed the Logo manual to read for homework. This provided him with many ideas about Logo primitives which might enable him to write more complex programs. He took himself beyond turtle

What is Logo, continued...

geometry to write an interactive program which enabled the user to choose a polygon with any number of sides of user-specified length for the turtle to draw.

This project of Jim's pushed my programming ability, for I, too, was a new Logo user. I would often take my back-up copy of his disk home to work out various ways to solve his programming problems and bugs. After inventing or getting myself help with possible solutions or simpler examples, I created a new file called HELP to provide him with examples of possible solutions to his problem.

Jim, being an independent thinker, would study the examples in my HELP file, then say thoughtfully, "No, I don't believe that I want to do it that way," and continue with his own exploration and problem solving. I did notice that some of the HELP ideas found their way into his programming, and most of the inventions remained Jim's own.

At the end of the session, Jim was still working on centering his polygons above the text, and I had begun to use a HELP file with other students.

My first task was to invent a computer culture.

My last example is Manual. I have no file for his work. He was the class conceptualizer. He had started using computers because he enjoyed the fast action and energy of video games. He knew what would make an exciting program. Manual would strike up a conversation with a likely programmer describing an idea for a program. The talk continued as the other student moved toward a computer and started working out Manual's ideas. When Manual was satisfied that the person was "hooked" on the idea, he retreated and started another person on another idea.

I have Manual to thank for the work I do in the middle of the night, figuring out how to make a ball-shaped turtle appear to "bounce" off the edges of the screen.

These stories offer examples of the many ways in which students can explore a computer environment using the Logo Language.

Perhaps I've made it sound as if it "just happens." Because Logo permits a student to discover in a manner which is natural to the learning process it may appear that I have undervalued the teacher's role. Now we will look at some of the ways I have come to think about my role as teacher in a Logo classroom.

The Teacher's Role

Every computing class I have led has been made up of students with a wide

variety of experience and knowledge about computers. Some students have never seen a real computer. Some may even be certain that the computer is *the* enemy of humanity and spend energy directing prejudicial comments toward it. Other students may own their own computers, belong to "user's clubs" and have been programming for years.

This situation in itself was somewhat unnerving to me. I had made a commitment to myself to become knowledgeable about Logo and instructional uses of computers in order to integrate this tool into a school curriculum. I was determined to create a relationship between the current computer revolution and life in school.

I had no models. I had never used a computer nor seen any person other than my husband use one. My first task was to invent a computer culture. This culture needed to be able to support all the students *and* me as a learner alongside them.

Any teacher's first job is to assess the situation and equip himself with:

- Knowledge
- Experience
- Hardware
- Time

We must examine our own attitudes about computers in our society, acknowledge the areas creating distress and identify the areas bringing optimism.

As Logo teachers our roles will cover a diverse, and perhaps uncomfortable range including demonstrator, teacher/lecturer, teller, time structurer, problem setter, management solver, arbitrator, decision maker, challenger, helper, collaborator, process sharer, question asker, idea extender, observer, documenter, admirer, enjoyer, time provider, technician, and model learner.

I require each student to keep a journal of process notes, questions and descriptions of problems encountered. I read these regularly and respond.

In response I might write a comment which is similar to an oral response, "That sounds frustrating," "Wow! You figured it out!"; "I'd like to see how your procedure works"; "Jim figured out how to do a similar problem, why not ask him for help next time?"; "I don't know the answer to this question, let's get together after school and visit the computer store."

The journals provide a valuable vehicle in which to keep track of progress and to allow patterns to become visible. Often simply describing a problem will allow a student to understand it more fully, and thus be able to solve it. Journals provide direct access to help. They enable students to formalize their own thinking.

The journals provide me with a sense of being in charge, of knowing what is going on, and, a means of keeping records of student work. They provide an opportunity for a personal relationship with each

student on a daily basis. Since I am also learning Logo, the journals provide me with a sense of comfort; I can see what I need to learn, and decide what my own homework will be.

Beyond this, the journals provide both the students and me with an assurance that this is a collaborative learning experience, and that I am working *with* them. Confidence about this alleviates, I believe, for both the students and me the sense of anxiety which might otherwise be present in teaching and learning this subject. Most educators agree that anxiety interferes with learning.

As a Logo programming teacher, it is my job to make back-up copies of all my students' disks in order to protect the students from work loss due to damage or filing mistakes and to enable me to see the patterns in the work of individuals so I can plan my next formal lesson for the class.

Journals provide direct access to help. They enable students to formalize their own thinking.

I can collect small groups of students around a common interest or programming problem. Sometimes I will ask a student to share some work with the whole group as a teaching example or as a model. By examining the work on the back-up disks I can also determine whether a programming problem should be solved with a "gift" of a tool which the programmer is probably not yet ready to invent on his own. (Some tools I have given include procedures for creating circles, explosions, and countdowns.)

The disks give me time to work on programming problems by *trying* the program, and trying several solutions, away from the stress of a class period. Inevitably the disks force me to think about my own next learning steps.

During the actual lab time I wander, watch, listen, and answer.

I feel that the words I use are important.

Instead of solving a problem for a youngster by telling or showing the solution immediately, I usually say: "describe the problem," "Tell me what happens," "What did you want to have happen?"; or "Try it now and show me." Some teachers ask the student to "Teach me what you did."

This type of response is important for several reasons.

- It gives me, as teacher, time.
- It gives the student time.

Everybody's making money selling microcomputers. Somebody's going to make money servicing them.

New NRI Home Study Course Shows You How to Make Money Servicing, Repairing, and Programming Personal and Small Business Computers

Seems like every time you turn around, somebody comes along with a new computer for home or business use. And what's made it all possible is the amazing microprocessor, the tiny little chip that's a computer in itself.

Using this new technology, the industry is offering compact, affordable computers that handle things like payrolls, billing, inventory, and other jobs for businesses of every size...perform household functions including budgeting, environmental systems control, indexing recipes. And thousands of hobbyists are already owners, experimenting and developing their own programs.

Growing Demand for Computer Technicians

This is only one of the growth factors influencing the increasing opportunities for qualified computer technicians. The U.S. Department of Labor projects over a 100% increase in job openings for the decade through 1985. Most of them *new* jobs created by the expanding world of the computer.

Learn at Home in Your Spare Time

NRI can train you for this exciting, rewarding field. Train you at home to service not only microcomputers, but word processors and data terminals, too. Train you at your convenience, with clearly written "bite-size" lessons that you do evenings or weekends, without going to classes or quitting your present job.

Your training is built around the latest model of the world's most popular computer. It's the amazing TRS-80™ Model III, with capabilities and features to perform a host of personal and business functions. No other small computer has so much software available for it, no other is used and relied

(TRS-80 is a trademark
of the Radio Shack
division of Tandy Corp.)

on by so many people. And it's yours to keep for personal or business use.

You get plenty of practical experience. Using the NRI Discovery Lab® that also comes as part of your course, you build and study circuits ranging from the simplest to the most advanced. You analyze and troubleshoot using the professional 4-function LCD digital multimeter you keep to use later in your work. Then you use the lab and meter to actually access the interior of your computer...build special circuits and write programs to control them. You "see" your computer at work and demonstrate its power.

Computer Assisted Instruction

Your TRS-80 even helps train you. You receive 4 special lesson tapes in BASIC computer language. Using them in your microcomputer, you "talk" to it as you progress. Errors are explained, graphics and animation drive home key points. Within a matter of minutes, you'll be able to write simple programs yourself.

Become the Complete Computer Person

In addition to training in BASIC and advanced machine language, you gain hands-on experi-

ence in the operation and application of computers to business and personal jobs. You're trained to become the fully rounded, new breed of technician who can interface with the operational, programming and service facets of today's computers. You're ready to take your place in the new electronic age.

Other Opportunities

NRI has been giving ambitious people new electronic skills since 1914. Today's offerings also include TV/Audio/Video Systems servicing with training on our exclusive Heath/Zenith computer-programmable 25" diagonal color TV...Industrial Electronics, Design Technology...and other state-of-the-art courses.

Free Catalog...Mail Card No Salesman Will Call

Send the postage-paid card for our 100-page catalog showing all courses with equipment and complete lesson plans. There's no obligation other than to yourself. See how NRI can help you grow with the most exciting and important new field of the 80's. If card has been removed, please write to us.

We'll give you tomorrow.

What is Logo, continued...

- Description is a matter-of-fact task which can diminish emotion and allow the describer to see what actually happened clearly. (Frequently in the middle of describing, a student will say "Oh, never mind, I see what I did.")

If after a student has described the problem and neither of us knows how to solve it, we write a plan together in plain English words. It includes a statement describing what the student *wanted* to have happen. Usually when a solution is not clear to either of us, we are working with an example which is too difficult for us. We substitute a simpler problem "for practice."

Then, together we write a superprocedure in the same way that Ted wrote one for his alphabet, before he had invented the subprocedures. I make very sure that the first step in the procedure is one that the student and I can solve successfully right then.

Other jobs for the teacher include collecting, displaying and identifying resources.

I have rarely seen a computer which is not surrounded by a group interacting with it and kibbitzing with each other in a most congenial way.

I use bulletin boards to stimulate the learning process. I might post a weekly "Mystery Procedure," a new command with its definition and examples of its use, a challenging programming idea, a procedure to copy, a picture of a student's procedure, or a chart of students' names indicating their specific areas of expertise in order to make peer tutoring possible for every student. Sometimes I post an interactive program for students to copy, use, then modify and make their own.

Creating a Supportive Community

The computer community which we establish in our classrooms is for many students (and teachers) a first computer culture. As educators, we must be concerned about the values which are formed and used by this community of learners.

Many question my use of the word "community" in connection with computers. However, I have rarely seen a computer which is not surrounded by a group interacting with it and kibbitzing with each other in a most congenial way.

Most computers are a social *and* an in-

tellectual center in a classroom unless usage is specifically regulated otherwise. Watchers see new ways to solve problems, participate in brainstorming new ideas and derive a great deal of pleasure from the process.

Teena Crowley, a third grade teacher, said, "I wish Logo were everyone's introduction to community work. Everyone is involved and offers input from the start."

Usually during a first class with a group I find it important to declare myself a Logo *learner* as well as a Logo teacher. I do it because it is honest and because it establishes a basis for collaboration. The responsibility for helping and teaching and creating this class belongs to all. It is an ideal opportunity for me to model the motto "Life Long Learning," certainly an important part of any curriculum.

Many issues emerge in the establishment of a Logo community. One of the first is the issue of ownership of procedures. Is it copying or stealing to save work which did not necessarily originate from the saver's own inspiration?

The nature of Logo filing and saving makes it almost impossible for beginning users to keep separate files, and so from the first time SAVE is typed, a file of mixed-up origin exists.

I prefer to be excited by the possibilities of this "sharing" rather than regret it as a necessary "evil." I legitimize the sharing, giving, changing, and using of one another's procedures as part of the context of the community we are creating together.

I share my work with my students and I encourage them to exchange procedures among themselves.

Classes soon begin to create a vocabulary specific to their community. In one class a procedure named WING — basically an outwardly spirally triangle which appeared to fly across the screen — became a favorite expression for a way of moving quickly across a space with arms rotating rhythmically. This reference point created a sense of cohesion and inclusion among classmates and added a dimension of good-natured humor.

I credit some of my success in creating a supportive community to my insistence that part of the experience in computer class is participating in discussions about ethical and responsible computer use.

I am genuinely worried about how our society makes decisions about computer use. I make clear to my students that computers are surrounded by a human culture with developed values and a sense of conscious choice about their use.

I believe that one way people develop into responsible, rational human beings is by participating in discussions about dilemmas with peers.

I often start a discussion with a simple story. Ideally, it describes an issue which is real or potential issue for this class, with-

out embarrassing any group member. Once I told about a filing mistake I made when making a back-up copy of Ted's alphabet. Half the procedures for creating letters disappeared through my mistake. I had to tell him what I had done to his work, and how sorry I was to have made such a silly and harmful mistake.

Part of the experience in computer class is participating in discussions about ethical and responsible computer use.

A 20-minute period of sharing of mistake stories followed. No one was required to talk, but all class members were expected to participate by being part of our circle. The rules also prevented comments or judgments being directed towards any person or point of view. Discussion was encouraged.

Other issues which have worked for discussions in my classes are:

- Scheduling of computer use.
- What about someone who doesn't take a turn?
- Is it okay to borrow disks, copy disks, change disks?
- What about using "bad" or "dirty" words to name procedures?
- Should all schools have computers?
- Should all kids have to learn to program a computer?
- Why would a girl want to use a computer?
- What kinds of information should a school computer keep?
- Is it possible to have a really "private" computer file?
- What are some ways computers work in our lives?
- How can I get my family to value my programming instead of dismissing me as a "brain"?

The discussion which touched me the most deeply was requested by my students at the end of a summer school session. The subject was: now that we know so much about computer programming, how can we help our teachers feel comfortable knowing less than we do, so we can have computers in schools?

Beyond these ways of thinking about structuring a class and a curriculum, there are many opportunities for collaborative programming. One teacher has helped her students create a class adventure game using Logo.

The class planned the rooms, and then pairs or individuals created the procedures

to make each room. Her role was to set up the structure and aid in the process of linking.

Harold Abelson's manual for Logo gives many examples of interactive programs which can be enjoyed by a class. Many teachers are using it to create their own programs for guessing numbers and creating crazy sentences.

Dan Watt's work creating curriculum for a dynamic turtle which moves according to laws of physics is interesting to use and then modify.

A great need exists for all Logo teachers to share their emerging curricula. This will enhance our collective understanding and provide more models about the ways students can work within a Logo environment.

What Logo Teachers Say They Teach

- Computer literacy.
- The history and learning theory in Logo.
- How to program a computer-like character, a turtle robot or Bit Trak.
- Controlling a turtle on a screen.
- How to pace out shapes and then teach the turtle to draw shapes.
- How to change pencolors and background colors.
- How to edit.
- How to initialize a disk.
- How to draw initials.
- How to use repeat.
- How to use subprocedures in procedures.
- How to use recursion.
- How to read a print-out of programs.

- How to draw procedure trees.
- How to use variables.
- How to use the Logo Manual.
- How to manage files and clear the workplace.
- How to use existing interactive programs and modify them.

This simple and straightforward list may be more or less what you expected. However when I ask my Logo students, whether school children or professional educators, what they learned in Logo class the list is quite different — fuller and more profound.

What Logo Students Say They Learn

- About problem solving and estimation.
- About thinking and learning styles.

What is Logo, continued...

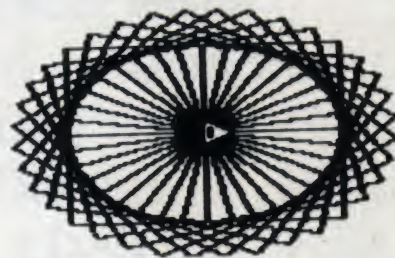

- About how to use their own learning style.
- To think logically.
- To work without emotional manipulations; the computer doesn't care whether you feel angry.
- To use procedural thinking.
- To use strategies for problem solving.
- To become comfortable thinking mathematically.
- To be able to think geometrically.
- To be able to consider laws of motion.
- About language by creating my own system for naming procedures.
- About graphics and design.
- How important revision of procedures and text is, and how simple it is to do.
- That decimals are useful.
- How to type.

- How to be patient.
 - How to take risks in working.
- The most significant things they claim to have learned include:
- Looking at their own mistakes with an interest in understanding what happened instead of shame.
 - Feeling competent in setting their own problems and supported in solving them.
 - Understanding that learning and doing involve frustration and ease; they go quickly or slowly, parts are intriguing or boring, and this is what makes up all work and life.

There is no question in my mind that working with computers is one way of forming a direct link with a sense of the future. Computers can provide a sense of

optimism, new frontiers to be explored, and a kingdom to be conquered.

Logo was developed to create an interactive environment, a mathland, in which students could set their own pace, problems and goals. It is a comfortable way for me to enter the future. It is a challenging way and it is a way that I can understand, choose and control. □

**This person
used to develop
applications for
the Z-80 market
with the best
of them.**

SOFTech
MICROSYSTEMS

This person develops applications for the entire market, including the Z-80, 8080, 8086/8088, 6502, LSI-11/PDP-11, 9900, and the M68000 with the best there is.

The UniversalTM Operating System.

Why does this application developer look so happy, you may ask?

Because, unlike others in his field, he's one of the smart ones. He uses the UCSD p-SystemTM from SofTech Microsystems. It's the first truly universal operating system ever developed. It lets him develop an awesome array of high-quality applications. And it's equally at home with an IBM PC, TRS-80TM Model II, Apple II[®], Osborne 1[™], TI Business System 200[™], Zenith Z-89[®], Hewlett-Packard HP-87[™], Philips P-2000[™], the new DEC Professionals[™], or any other micro in the market.

That makes our developer one of the elite. Because he'll never have to worry about locking himself into an operating system that will eventually lock him out of the market.

A Universal Operating System. At last.

Whether it's a Z-80, 8086/8088, M68000, 6502, or you name it, the p-System is portable across any popular microprocessor made anywhere today.

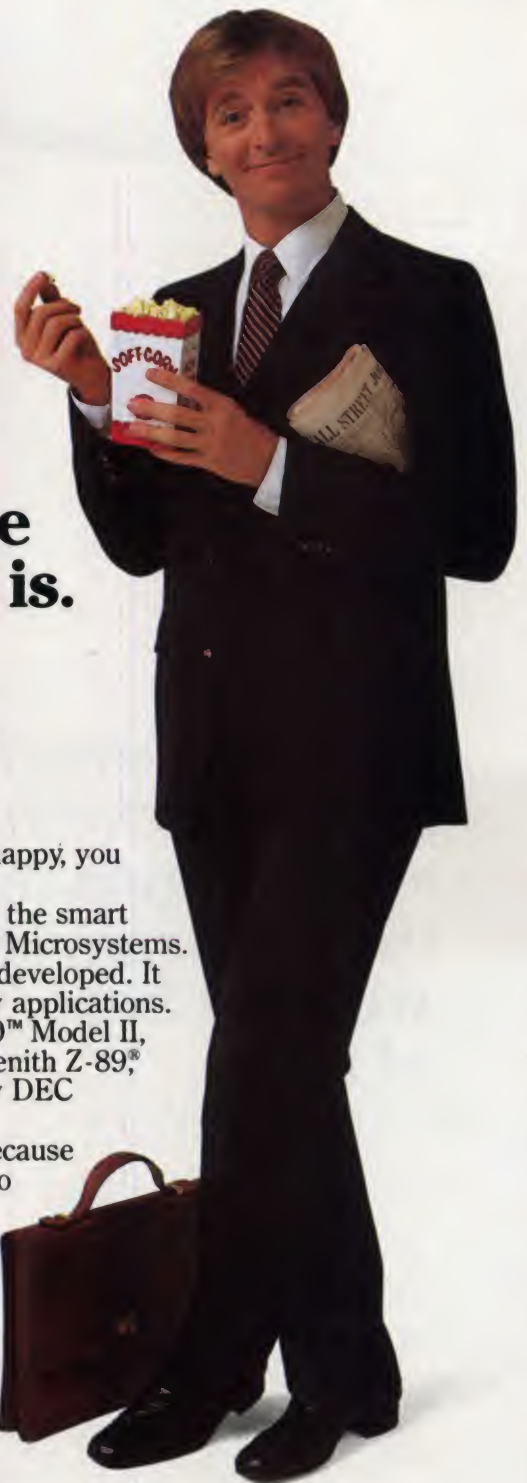

And we don't mean just at the source code level, either. We mean you can develop your program, on any machine, then compile to object code (p-code), and it's totally transportable.

You get it done right the first time. Every time. For any machine.

Now you can design for the whole market.

Once and for all.

The p-System actually enables you to broaden your customer base without significant reinvestment in programming, time and time again. Simply because it's the only OS that runs the same object code programs on all popular 8- and 16-bit microprocessors. No matter who makes them. No matter who uses them.

And that's only the beginning. There's more to the p-System philosophy. Much more.

Take programmer productivity, for example. We know how much work you put into programming, so we understand the importance of streamlining that process. So we saw to it that the p-System allows you to reuse program components, time and time again.

It's been our experience that as much as 50% of the code developed for one application can be reused on others. And you can also create your own library of utilities suited to solving your own unique problems.

Try finding that on some other operating system.

All the tools you need for the job. Any job.

When you write your programs with the p-System, you can use any combination of UCSD Pascal™, FORTRAN-77 and BASIC. Each language operating effectively with the others. So you can finally take advantage of the best features of each language—in a single program. And you also get a complete, fully integrated set of software development tools to make your job even simpler. Naturally. Including a screen editor, macro assemblers, and a debugger, as well as add-ons such as TURTLEGRAPHICS, Native Code Generators, and even Print Spoolers.

Our admirers have impeccable credentials.

In case you wondered who else believes in our Universal Operating System, there's the fact that the p-System is licensed by most of the major hardware manufacturers around. Manufacturers like IBM, DEC, TI, HP, Commodore, Osborne, Philips, and Zenith. You know, all those "little guys."

And the p-System's reliability is well-documented. Has been since 1977. And this, coupled with the upward compatibility of source code programs, has given the p-System five years of proven, documented field testing. By the toughest critics in the business.

Given all this, it's easy to see how your productivity can be enhanced.

Now you can develop higher quality applications faster, less expensively, and more dependably than ever before. For a much larger market.

All at the same time.

All on one machine.

All without worrying about some hardware enhancement limiting your business opportunities and leaving you with no other choice than peddling popcorn or ice cream on some lonely street corner.

If you don't believe it just take a look at our Applications Catalog to prove it.

At last, using the p-System, you can design programs once.

Once and for all.

VINEONISC UPDATE

Anyone trying to track down the Aurora interface (Apple II to Pioneer VP-1000 videodisc player) mentioned in our January 1982 issue may have had a problem. Reason: Aurora is still around but they sold the rights to the interface to another firm, Anthro-Digital Software, P.O. Box 1385, Pittsfield, MA 01202. It's now called the Omniscan Laser Video Disc Interface and is available with software for \$250.

Anthro-Digital also offers a Flipper for \$50 which switches Apple output signals (two in to one out or one in to either of two outs), an excellent word processing system (The Executive Secretary), a mini word processor for the Hebrew language (\$60) and several other interesting products.

AMDEK PRICING

Two new Amdek products were mentioned on this page in the August issue. The final prices announced at MCC were different than our advance information. The 3" microfloppy disk drive is \$899 (not \$699) and the digital plotter is bargain priced at \$949 (not \$1200-1300).

JAPAN, INC. GETS SMARTER ABOUT SOFTWARE

For three years we have been admiring the computers and peripherals from various Japanese makers. But none has really proved a threat to American makers. Why not? In one word, software, or lack thereof. As I observed back in the October 1975 Creative Computing, a computer without good software might as well be a boat anchor.

Not many Japanese computers have wound up as boat anchors, but not many have been sold in the U.S. either. However, that is about to change dramatically with the strokes of several pens on contracts between Microsoft and three Japanese manufacturers.

MS-DOS, a 16-bit operating system developed by Microsoft for the IBM PC, will be implemented on computers from Hitachi, NEC, and Panasonic. Also, Wang, a major force in the WP market, has tapped Microsoft to implement MS-DOS on their low-end "professional computers."

Along a similar vein, the Structured Systems Group has also signed on the dotted line to convert their accounting software to several Japanese makes.

As if this weren't enough, take a look at the phenomenal amount of software released by NEC for the PC8000 series (see CES/MCC report in this issue). Not only that, but NEC has announced a similar commitment for the just-announced Advanced Personal Computer.

We also can't help but be mightily impressed with the new 16-bit Mitsubishi computer. It supports CP/M-86 and has dual 300K disk drives and 128K RAM standard. As if that weren't enough, it also includes IBM 3270 emulation, Tektronix 4010 emulation, MBasic Plus, Fortran, Cobol and two versions of Pascal.

Someone must have told the Japanese about software. They listened and learned fast!

ATARI/LUCASFILMS JOINT VENTURE

In an uncharacteristically low-key press conference at CES, Atari announced the formation of a new company owned 50-50 by Atari and Lucasfilms (creators of Star Wars, Empire Strikes Back and Raiders of the Lost Ark). The union was apparently sparked by Smalltalk-creator Alan Kay formerly of Xerox PARC (Palo Alto Research Center), now of Atari. What did Alan Kay have to say? Well, seems he ducked out of the press reception early--if he was ever there at all.

Anyway, after ducking all questions, an unnamed spokesman for Atari told us that the first product of the joint venture will be a video game based on Raiders of the Lost Ark. What else? No answer.

Are we optimistic? Guardedly, yes. But as Charlie Brown once said, "there is no greater burden than having a great potential."

TRS-80 COLOR COMPUTER TO BE SOLD IN INDEPENDENT OUTLETS

Tandy with some 6000 Radio shack outlets for TRS-80 computers is looking for even greater retail penetration. A first move toward this goal is the signing on of 60 RCA consumer electronics distributors to handle a repackaged version of the TRS-80 Color Computer. These 60 distributors service about 2000 retail outlets.

The color computer will be repackaged in a white case and will carry the designation TDP System 100, with TDP standing for Tandy Distributor Products. Pricing will be comparable to the existing unit in Radio Shack stores (\$399 for 16K version, \$499 with extended Basic).

MATTEL: HERE WE GO AGAIN

The on-again, off-again release of the keyboard unit for the Mattel Intellivision video game accompanied by lower and lower prices is on again. The original price of \$700 in October 1979 was far over competitive units. However, pricing was the least of Mattel's problems since the keyboard unit was plagued with hardware problems and lacked applications software.

A re-release of a re-engineered unit at a lower price is now scheduled for 1983. 1983!? Well, we'll see.

K-MART COMMITTING TO COMPUTERS

K-Mart announced that 1100 stores will handle the Commodore VIC-20, up from 550 stores two months ago. In addition, a spokesman confirmed that the chain has committed to an equal dollar amount (around \$10 million) of TI 99/4A home computers. The chain also expects to handle the lower-priced (\$100) Timex/Sinclair unit.

The Role of Motivation in Computer-Assisted Instruction

Richard P. Swenson and Chrys Anderson

In one of his early (1961) articles, noted Harvard psychologist B.F. Skinner decried the common use of aversive techniques in the classroom. In Skinner's opinion, "The birch rod and cane are gone, but their place has been taken by equally effective punishments (criticism, possible ridicule, failure)...the student must learn, or else!"

Studies in the area of human learning have repeatedly demonstrated that the best teaching methods are those that rely most heavily on positive techniques to motivate people. Since motivation has been identified as a critical component in learning, it makes a great deal of intuitive sense to apply the knowledge we have about motivation to one of the newest and most promising forms of education, instruction via computer, or computer-assisted instruction (CAI).

An essential prelude to a discussion about motivation is an explanation of the role of reinforcement in learning. Reinforcement is a technical term used by psychologists. It refers to any event which follows a behavior and subsequently increases the likelihood that the behavior will occur again. A reinforcer increases

the frequency of the behavior it follows.

Good teachers are skilled at identifying and delivering reinforcers in the classroom. For many young children, verbal praise ("Good work!") is a very effective reinforcer. Stars or points to be accumulated and exchanged for some privilege are also useful.

An important aspect of reinforcement is the fact that, by definition, it must be

***Children prefer to
watch a video alligator
eat a stick man than
see the man escape
unscathed.***

individualized. What is reinforcing to Johnny will not necessarily be reinforcing to Jane. To determine if a suspected reinforcer is effective, it must be tested empirically; it must be validated.

In the design of educational software, the role of reinforcement is too important to overlook. We are aware of two instances in which intrepid programmers

created such clever reinforcement routines that they felt no need to validate them. In one case, the feedback routine was designed to send a Snoopy dog parading across the screen with a sign that read "Good job!" Snoopy was programmed to make that entrance whenever a student made a correct response to a question posed by the computer.

If, on the other hand, the student made an incorrect response, Snoopy made his appearance by walking upside down across the top of the video screen, dropping his sign about halfway across. Not too surprisingly, many students deliberately chose wrong answers so they could see Snoopy upside down on the screen, which was much more interesting than the intended reinforcer. The programmer had guessed what the students would "work for"—and guessed wrong.

Similarly, another programmer learned the hard way that children prefer to watch a video alligator eat a stick man than see the man escape unscathed. The lesson to be learned in both cases is the same: a routine is only reinforcing if it works, and the only way to determine if it works is to put it to an empirical test. Since a reinforcement routine which "isn't" can negate an otherwise excellent program, it is clearly worth the time it takes to test it.

FIRST: MONSTER MOVIES NOW:
CRUSH, CRUMBLE & CHOMP!
THE GREAT MOVIE MONSTER COMPUTER GAME!

And guess who stars as the movie monster. You! As any of six different monsters. More if you have the disk version.

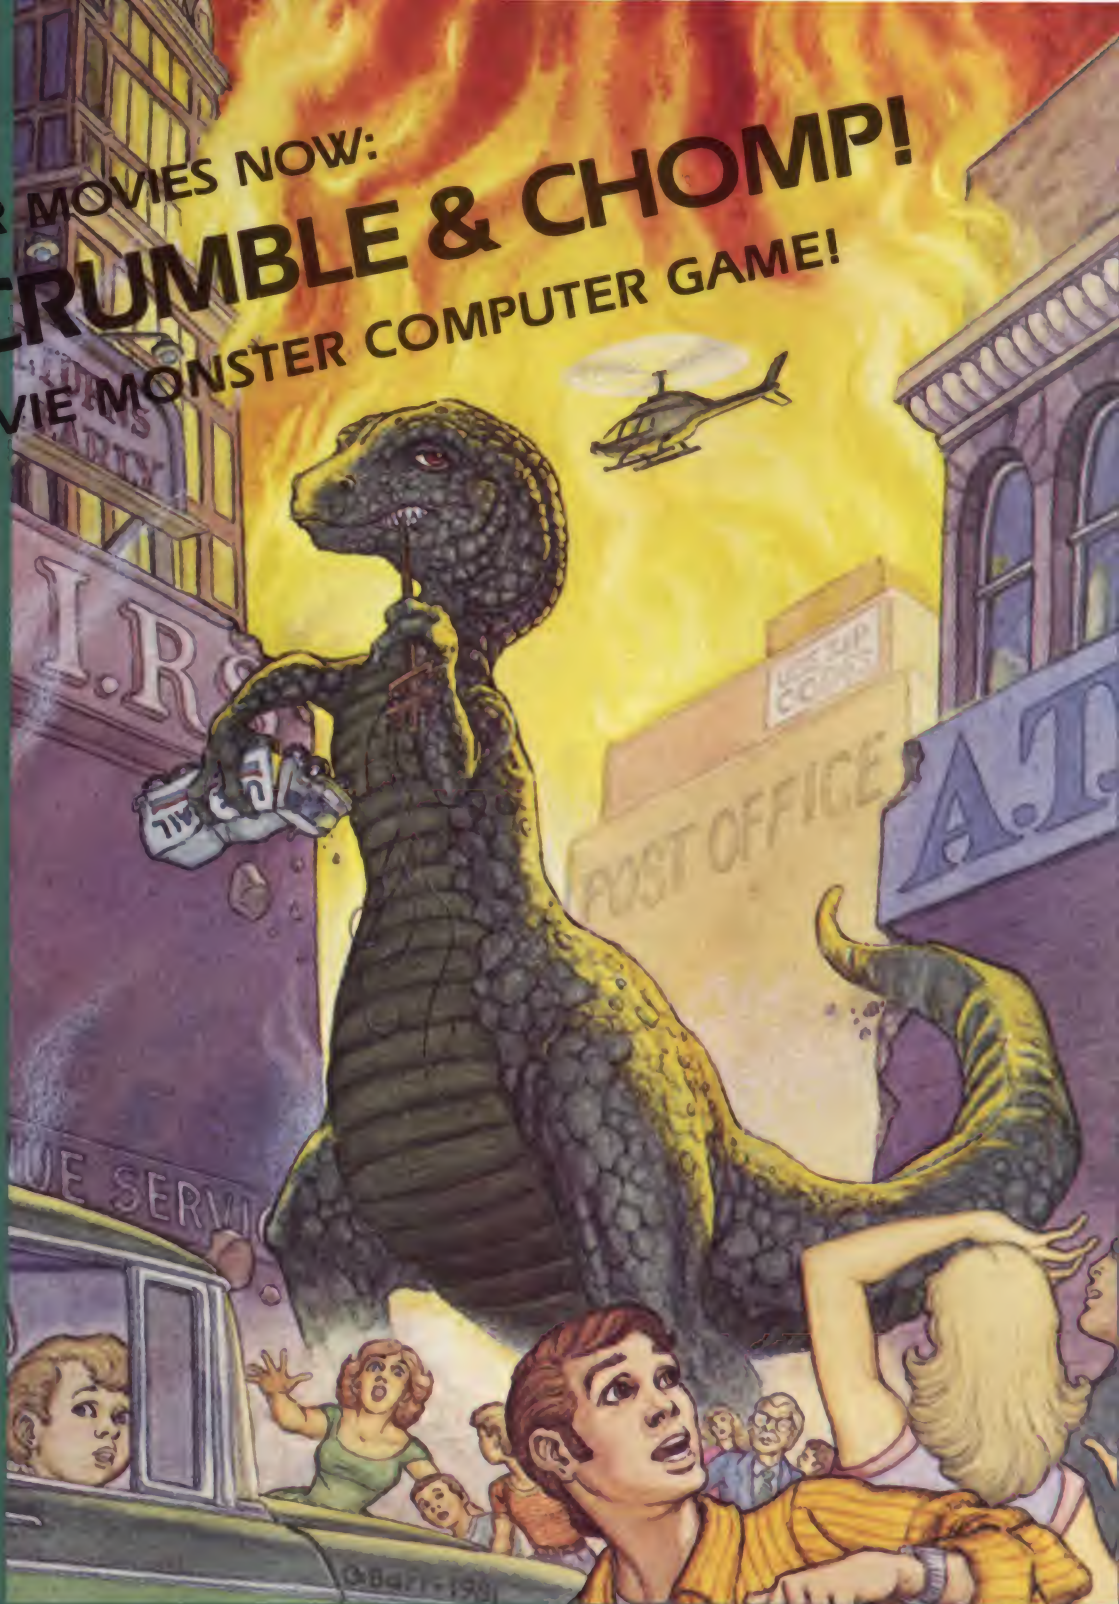

You can terrorize and destroy four of the world's largest and most densely populated cities in over 100 possible scenarios. From Tokyo to the Golden Gate, you are the deadliest creature in the air, on the land, or in the sea.

You can be the deadly amphibian who simultaneously smashes street cars, lunches on helpless humans and radiates a ray of death.

If you were a giant winged creature, think of the aerial attacks you could make on the terrified but tasty tidbits beneath you.

But as in all the best monster movies, you're up against everything the human race can throw at you—even nuclear warheads and a strange concoction developed by a team of mad scientists.

For only \$29.95 you get 6 stupendous monsters, each with its own monstrous summary card, 4 teeming metropolises displayed in graphic detail on your computer display and mapped in the accompanying 48-page illustrated book, the awesome sounds of monsterly mayhem, and spine-tingling, real-time, edge-of-your-seat excitement.

GET CRUSH, CRUMBLE & CHOMP

PERSONAL COMPUTER

PROFESSIONAL COMPUTER

TURN YOUR APPLETM PERSONAL COMPUTER INTO A PROFESSIONAL COMPUTER FOR \$750.

The majority of all professional computer software programs available today are written for the CP/M[®] disk operating system. The SYNERGIZER lets you access all of this vast body of sophisticated software with your Apple II while retaining the capability to access your present Apple software.

In addition to the CP/M interface and software diskette, the SYNERGIZER gives you the required 80 column display and 16K RAM

memory expansion boards, the *CP/M Handbook* by Rodney Zaks, and complete manuals. You get *everything* you need for fast, easy installation and operation in one package.* Each element is designed to complement the others, and everything is designed and produced by the *same* company.

The SYNERGIZER. It'll turn your Apple into a professional computer. And it costs only \$750. Phone or write us, or ask your dealer for a SYNERGIZER brochure. Now.

SYNERGIZERTM

Motivation

From the preceding discussion, perhaps it is obvious that the most important function of reinforcement in a CAI program is a motivational one. It provides the student with a reason to keep learning. But reinforcers differ in kind. Reinforcement is frequently characterized as primary, secondary or generalized.

Primary reinforcers are those which are essentially unlearned and which are almost universally reinforcing. Their motivational properties seem to be inherent so no learning is necessary. Food when hungry, and water when thirsty, are good examples of primary reinforcers. Stimulation, visual or tactile, can also be considered a primary reinforcer.

In terms of the computer, visually stimulating things like "crazy art" (randomly generated flashing lines) perhaps come the closest to fitting the definition of a primary reinforcer. A person apparently need not learn to be entertained by the appearance of visually stimulating material on the screen.

Secondary reinforcers are no less potent motivationally, but they are learned motivators. Praise is the classic example of a secondary reinforcer. It means nothing to a newborn, but most of us, at some point in the course of our socialization, learn to value the praise of others, initially our parents and later other "important persons." An example of a routine using secondary reinforcement on the computer would be one which allowed the user to earn the opportunity to play a video game.

Generalized reinforcers are actually a special class of secondary reinforcers. They require learning as do all secondary reinforcers, but they are general rather than specific. Money is the best example. Money is an extremely powerful reinforcer in our society not because of its intrinsic worth, but because it can be exchanged for things which are valuable (shelter, clothing, food).

On the computer, a generalized reinforcer might be given in the form of a point, star or other marking on the screen. The accumulated points would become valuable if they could subsequently be exchanged for privileges or valued objects.

There are advantages and disadvantages associated with each class of reinforcer. Generalized reinforcers have one big advantage insofar as it is very difficult to satiate or become tired of them. To the extent that they are general (e.g., they can be exchanged for any number of different things), the user does not tire of accumulating them. It is, on the other hand, relatively easy to satiate a person with primary and secondary reinforcers if they are programmed to be delivered at a high rate.

However, the use of generalized reinforcers in CAI has a major disadvantage—the reinforcers are external to the computer. Both secondary and primary reinforcement routines can be totally self-contained. The motivational system is built-in to the computer program. Generalized reinforcers, on the other hand, depend on occurrences totally independent of the machine. True, the computer can reliably deliver the points (or whatever) dependent on a student's response, but it can't see to it that the points are subsequently exchanged for something of value (a grade, praise or money). If the accumulated reinforcers are never exchanged, they will probably lose their reinforcing qualities in a short time.

There are no rules to tell us when to use a particular kind of reinforcement. Experience and knowledge of the results of various studies allow us to make educated guesses about what is likely to be most effective for a given audience.

Reinforcement designed for computer software can also be described along a continuum of "obtrusiveness." As such, it can be passive, active or interactive.

The timing of reinforcement is as important as its occurrence.

Reinforcement which is passive only delivers information about the adequacy of a user response. For example, a program which presents a new arithmetic problem when the previous one has been correctly answered is passively reinforcing. The user is informed that the response was correct; but nothing else happens on the screen.

Active reinforcement also provides information about response adequacy, but the reinforcement event contains additional information as well. The additional information might be in the form of added visual stimulation (e.g., flashing happy faces) or it might contain elements of positive praise ("Good job, Charlie!").

The critical difference between the two types of reinforcement is the addition of information above and beyond the simple acknowledgement of a correct response. This additional information tells the student that "someone" is pleased and happy about his success.

Interactive reinforcement has all the properties of both passive and active reinforcement, but it adds a new dimension—it allows user participation. A video

game which can be played only after the user has made a correct response falls into this category.

To design educational software with highly effective motivational routines, one must first recognize the critical nature of the role of reinforcement and the dimensions along which reinforcers can vary. The next step involves understanding some of the variables which influence the *effectiveness* of the reinforcer. We will limit our examination to four of the most important variables: timing, appropriateness, relevancy, and configuration.

Timing

The timing of reinforcement is as important as its occurrence. In other words, if the timing is off, there is little value in delivering the reinforcer. Chances are very great that an improperly timed reinforcer will actually reinforce something other than the desired response.

To be most effective, reinforcement should occur immediately after the desired response. (In fact, the literature shows that the ideal interval between the response and the reinforcer is .5 seconds.) Initially, the reinforcer should be delivered every time the desired response occurs. This is true whenever an individual is learning a new skill. As the individual gains some experience and knowledge, the reinforcement schedule should be "thinned out"; it should be given less than every time the desired response occurs (e.g., every other time or every fifth time).

Timing is an especially critical variable of reinforcement with important implications for educational software programs. Not only are immediacy and scheduling important factors, but there is an additional temporal element to consider—length or duration of reinforcer. Assuming that the reinforcement event has a discrete beginning and end, how long should it appear on the screen?

There is obviously no simple answer to that question. It depends to a great extent on the type of reinforcement used in a particular program. An interactive reinforcement in the form of a challenging Star Wars-type game can be effective if it is programmed to last several minutes. An active reinforcer such as a happy face or a "good job" message will quickly lose its effectiveness if it appears on the screen for longer than a few seconds.

Appropriateness

Appropriateness of reinforcement is another important consideration. At an abstract level, there is no such thing as an "appropriate" reinforcer; there are simply effective and ineffective ones. At a different level, appropriateness does become an issue.

IT'S TIME KIDS STARTED USING STRONG LANGUAGE.

We encourage it.

Because now the most powerful educational language is available on the Apple Personal Computer.

Presenting Apple Logo.

It's not just a programming language for computers, but a learning language for people.

Enough so that anyone, working with Apple Logo, can easily learn the programming principles once reserved for college courses.

Apple Logo encourages you to break problems into small steps, and then shows you how to make those steps automatic.

It does all this interactively.

For instance, if you accidentally type "foreword," instead of forward, Apple Logo responds with "I don't know how to foreword."

There is no such thing as a mistake with Apple Logo, only logical statements telling you what needs to be done to make the program work. So the student programs the computer. Not the computer the student.

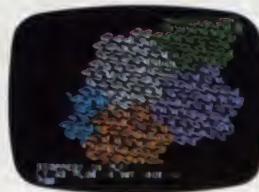

And as you learn, Apple Logo learns with you. So whether you're a student of 5 or 55, you'll always be challenged—but not overwhelmed.

Apple Logo runs on the Apple II with 64K. And it comes from Apple, the leading personal computer company in education—with the largest library of courseware at all levels.

Apple Logo. It can make getting to know a computer the most positive of learning experiences.

Your kids will swear by it.

The personal computer.

CIRCLE 110 ON READER SERVICE CARD

Role of Motivation, continued...

Before planning any aspect of the motivational routine, a programmer must know the audience for which it is intended. Age of the audience is an extremely important factor. Clearly, what turns a 5-year-old on is unlikely to have much appeal to someone who is 50.

The best information a program designer can have is that stemming from an empirical test. If you really want to determine if a happy face reinforces a 10-year-old, the way to find out is to test as many of them as are willing, able and available. There is no substitute for an empirical test.

Another audience variable which must be considered is nature of disability, if any. For instance, let's look at an educational program geared toward teaching about common anti-epileptic medications and their side effects. The audience in this case would probably be epileptics and parents and professionals who deal with epileptics. It would, then, be clearly inappropriate to design a motivational routine which employed flashing lights or pictures of any sort, since flashing is an environmental condition known to precipitate seizures.

Similarly, materials directed toward students with learning disabilities or autism must be designed specifically for those groups. Autistic children, for example, have been found to "over-react" to certain kinds of visual stimulation and to select irrelevant aspects of a stimulus display when learning.

With the learning disabled student, planning is even more complicated since there are so many different disabilities

which require unique interventions. The child with dyslexia will have substantially different needs than the child who occasionally reverses digits.

Relevancy

Relevancy of reinforcement is a relatively new consideration stimulated by attempts to design better and better computer courseware. The goal of educational software is to teach concepts and skills in the most expedient way. Research in the areas of psychology and human learning shows that reinforcement is critically important. An individual must be motivated to learn.

The goal of educational software is to teach concepts and skills in the most expedient way.

To be maximally efficient, reinforcement should be not only motivational but informational as well. In other words, the event designed to be reinforced should, if at all possible, also add to the user's information about the subject matter. For example, a word game might be the reinforcer following a lesson in English, or an exciting game routine might require the application of newly-learned math skills.

Configuration

When we speak of configuration, we refer to the feedback routine as a whole and not just its reinforcement component. Although it is possible to structure a program to minimize student errors, in most programs students will continue to make several or, perhaps, many errors before they learn the material well enough to make only correct responses.

As long as students continue to make errors, the computer must be programmed to deal with those errors in some way. The psychological literature, and our own years of experience in teaching, point out the need not only to accentuate the positive but also to minimize the negative aspects of feedback. We have drawn the conclusion that as far as incorrect responses are concerned, the less said the better. Of course, the student requires the basic feedback that a given response was incorrect, but any additional, judgmental information is not only unnecessary but undesirable.

By this time, it should be increasingly clear that developing sound motivational routines for educational software is a complicated and challenging proposition. There are no simple rules of thumb, no universal truths. There have been many studies done in the unending attempt to discover how and why people learn, and some of those findings have been summarized above. Two final points are in order, however, before we conclude this discussion.

Psychologists have long talked about an "inverted U-shaped curve" of motivation. In so doing, they refer to the relationship between the speed of learning and the strength of a given motivator at a given time. As the incentive or motivation becomes more compelling, an individual's rate of learning will improve...up to a point. Beyond that point, performance will actually be hindered.

This makes a great deal of intuitive sense if you think of the increasing pressure on an individual to respond correctly. At a certain level, the pressure becomes too great—too much hinges on his response. Elements of anxiety begin to enter the picture and performance begins to deteriorate correspondingly. In the design of educational software, then, you can have too much of a good thing.

This brings us up to the second and final point. There is a danger that reinforcement routines can be distracting. Two minutes of shooting down planes on the screen as a reward for an instructional segment completed may put the student into a different mood that is detrimental to efficient learning. Once again, the best way to determine the optimal circumstances for learning using the computer is the empirical test. There is no substitute.

"Can I borrow the calculator tonight?"

International Computer Problem Solving Contest II Results

Donald T. Piele

Devising a computer problem solving contest for the growing crop of young, talented computer problem solvers becomes more difficult each year. The problem is this: How do you create a set of five programming problems that will keep a team of three computer whiz kids busy for two hours and at the same time not be a frustrating experience for a beginning team?

Last spring Tim Fossum, a colleague at the University of Wisconsin-Parkside, and I faced this problem for the sixth consecutive year. In each of the three divisions; elementary grades (4-6), junior (grades 7-9), and senior (grades 10-12), we created a set of five computer problem questions. All three sets appeared last month in this column and interested readers were invited to solve them. This month, as promised, we present a complete set of solutions to all 15 problems (five for each division) along with an announcement of the top teams in each division.

Elementary Division

At the request of several local contest directors, we agreed to experiment with an elementary division this year for stu-

Radio Shack's new Color LOGO helps them use the most powerful processors in the world...

...their own minds.

Our remarkable new Color LOGO programming language and a TRS-80® Color Computer will enable children to make a myriad of discoveries. Color LOGO will pique curiosity, and excite young minds. Students will welcome each new challenge. And to welcome the challenge is the secret to learning.

A Language for Learning. The Color LOGO language is designed to help students grasp graphic relationships. It's easy to learn and fun to use. Through manipulation of "turtle" graphics, students learn to program. The benefits? The computer becomes a friendly learning tool, and students gain valuable insight into advanced concepts.

Something for Everyone. Children who haven't yet begun to read can use a "doodle" mode to create their own graphics. And a "hatch" command creates multiple turtles, capable of running separate programs simultaneously — a fascinating programming concept for students of all ages.

Low Cost Makes It Ideal for Classroom Use. Similar programming languages are expensive to implement because they require very large amounts of memory. But not Radio Shack Color LOGO. Our disk version is just \$99. It requires only the \$649.95 32K Extended BASIC Color Computer and a \$599 Color Disk Drive. And we have a Program Pak™ (ROM) version that's soon to be available. It will require only our \$399.95 16K Color Computer. Use your own color TV with either version. Both include an excellent instruction manual with lessons and programs for both the beginner and advanced user.

Discover the World of Color LOGO. Stop in today at a Radio Shack Computer Center, store or participating dealer near you.

For the name of the full-time educational coordinator in your area, call Radio Shack's Education Division at 800-433-5682 toll-free. In Texas, call 800-772-8538.

dents in grades 4 through 6. We were surprised to discover that over 118 teams at 46 contest sites participated officially.

First place in the elementary division went to the Apple Maniacs, Nick Wilt and Jason Hagen, from Park Road Elementary School in Pittsford, NY. They were the only team to solve all five problems successfully. The contest director was Margaret Kinney, a parent volunteer who teaches programming at two of the Pittsford Schools.

Second place was shared by six teams who solved four problems very well, and

third place was shared by eight teams who also solved four but not without some difficulty. Several schools were also cited for honorable mention. The complete rankings appear in Figure 1.

Junior Division

We received the results from 307 teams in 83 local contest sites in the junior division. Top honors went to The Two Charlies, a team consisting of Charles Tsai and Chuck Williamson from Salem. Their advisor, Harold Snyder, reports that both

boys are outstanding students and very active in the Continental Mathematics League and the Atlantic-Pacific Mathematics League contests.

Charles Tsai, a freshman at South Salem High School last year, had the top individual total score during the year for his school. He has his own TRS-80 at home and programs in Basic and machine language.

Chuck Williamson was an eighth grader at Leslie Middle School, next door to South High, which made it convenient for him to take honors geometry at South High while still in junior high. Chuck uses an Apple II at home but during the contest The Two Charlies used a SOL computer and wrote their programs in Microsoft Basic.

Second and third place honors were awarded to eight other teams. All of these teams solved all five problems. The complete list of winners appears in Figure 2.

Senior Division

As usual the senior division was the most popular. Results from 586 teams were reported from 147 contest sites. First place in the senior division went to the team of Spencer Greene and Truman Joe of Klein High School in Spring, TX. Their school adviser, Josie Mallery, said both are talented academically and shine particularly in mathematics.

Spence, a sophomore, and Truman, a junior, both have Apple II computers at home and write programs in Basic and assembly language. Both boys compete regularly in mathematics competitions and Spence is preparing for the Mathematics Olympian sponsored by the National Council of Teachers of Mathematics.

They correctly solved all five problems on an Apple II computer. Second place went to the Return of The Electronic Imbroglio, a team from Cambridge Rindge and Latin School in Cambridge, MA.

Eight teams finished in third place. Each team solved all five problems with varying degrees of ease and style. The complete list of winners appears in Figure 3.

Overall Results

On the surface it might appear that this year's contest problems were too easy since so many junior and senior division teams solved all five problems. But in fact it turned out to be just about right since only 1.7% of the senior teams and 3% of the junior teams solved all five problems. The average number of problems solved (out of five possible) was 1.6 in the senior division and 1.3 in the junior division.

It appears that the gap between the experienced teams and the beginning

teams is getting wider as microcomputers become commonplace in elementary and secondary schools across the country. The few schools that have been involved with microcomputers for several years are beginning to see the results of providing talented kids access to computers.

The level of difficulty for each contest problem can be judged by observing the frequency with which the problem was solved during the contest. This number appears as a percentage in Table 1. Thus a low value means the problem was more difficult.

Focus

One of the reasons that we continue to create the problems for this programming

contest is because it is fun and a challenge. From the feedback we get from local contest directors, this is the same reason their students enjoy entering the contest.

The problems we select require a combination of skills: 1) Good control of a programming language—every problem can be solved using standard Basic (All of the teams which were ranked this year used Basic. Advisors of the few teams that used Pascal reported a severe handicap because of the time needed to compile the program and the string handling limitations); 2) The ability to solve problems in general; 3) Experience in implementing a problem solving strategy within the context of a computer language.

COMPUTER GRAPHICS

for the Artist

Special Effects

by David Lubar and Mark Pelczarski

Paint on your computer in over 100 colors with 96 different brushes! Magnify mode for precision touch-ups; mirror image; color reverses; move any part of picture anywhere; packing routine for increased disk storage of any standard graphics screen. Can be used by anyone. Paddle/joystick \$39.95. Apple Graphics Tablet \$69.95.

**penguin
software**

830 4th Avenue, Geneva, Illinois 60134 (312) 232-1984

All Penguin applications products are now on unprotected disks for your convenience. Apple II is a trademark of Apple Computer, Inc.

for the Designer

THE COMPLETE GRAPHICS SYSTEM II

by Mark Pelczarski

Everything needed for computer-aided design. Easily draw and design in two or three dimensions, mix text and graphics freely, define shapes and create typefaces with unique character generator. Great for presentations, videotape displays, storing designs on disks, graphics for other programs, or just for experimentation. Paddle/joystick \$69.95, Apple Graphics Tablet \$119.95. 50 additional fonts, \$19.95.

for the Programmer

The Graphics Magician

by Mark Pelczarski, David Lubar, and Chris Jochumson

Add fast, smooth animation and hundreds of pictures to your programs. Create animated shapes and draw paths; have up to 32 independently controlled figures on screen. Use a special palette of over 100 colors to create pictures and objects in highly compressed format. Easy to use, and includes a special programming tutorial. Has saved months in development time for several games already on the market. Paddle/joystick \$59.95, Apple Graphics Tablet \$69.95.

CIRCLE 238 ON READER SERVICE CARD

How to Solve It, continued...

The problems we use are generally classified as:

- 1) Words: Searching/sorting, replacing, rearranging, modifying.
- 2) Numbers: Multiple precision arithmetic, special properties.
- 3) Simulations: Simple games or experiments.
- 4) Print Graphics: Designs that can be printed out.
- 5) Puzzles

We were pleased to hear reports from several contest directors that our problem solving emphasis is causing some advisors to change the focus of their curriculum. In some areas teachers came to the contest specifically to see how their curriculum could be modified to help students prepare for the next contest.

Conclusion

It has never been the intention of this contest to glorify the winning team or the concept of winning in general. There is no trip to Disneyland or free micro-computer for the winning team. The top team in each division simply has their names and the name of their school engraved on a traveling silver trophy which they can keep for one year.

Most of the recognition involved with this contest comes at the local level. Several directors sent us newspaper stories describing the outcome of the local contest which often involved an awards presentation and sometimes even a dinner. Providing this kind of recognition can only be done at the local level where getting your name printed in the local newspaper is always a thrill.

Finally, our congratulations go to each student who participated this year. Only one team, of course, can "win" in the sense of being ranked first in its division. But from what we saw in the returns, there are many young students who are winners all over the world. These students have demonstrated their ability to take on a difficult challenge and give it their best shot.

Post Script

Next year's contest will be held on Saturday, April 30, 1983. Schools that cannot hold the contest on this date will be allowed to hold the contest on Friday, April 29. In order to continue organizing and printing the contest, a small fee of \$2 will be charged to each local contest site within the United States.

Foreign countries will be charged \$5, the extra amount needed to cover postage. All funds will be used to support the contest. Complete details will be announced in this column in January. Interested parties who write for information should include a stamped self-

who participated in last year's contest will automatically receive an entry form in January.

Interested in the IBM Personal Computer?

If you're interested in the IBM Personal Computer then you need PC magazine. PC magazine is the Independent Guide to IBM Personal Computers. Each issue is packed with information for everyone interested in IBM Personal Computers.

PC magazine tells you how to put together the best IBM "PC" system and then how to get the most out of it. Each issue brings you hundreds of colorful pages of evaluations, insights, and straight talk from respected experts—professionals in computer science as well as writers, businessmen, lawyers, educators, and many others.

PC covers software, hardware, applications and most every topic of importance to the thousands of IBM Personal Computer users who read it. To ensure that we give you the information you need, PC includes a special "User-to-User" section, as well as a "PC Wish List", and news about IBM Personal

now. If not fully satisfied when you receive your first copy of PC, simply return your mailing label within 15 days for a full refund.

Accounting Plus II™

Plus...

Software Dimensions announces three new modules for Apple II* users with Accounting Plus II—each designed with the same high standards and human engineering factors that have made Accounting Plus II so popular.

With **Invoices Plus** you can inventory items just by entering part numbers; easily invoice non-standard items and miscellaneous charges; place user-defined comment lines on the invoice; get twice as many line items per invoice; automatically generate multiple pages; specify individual invoice numbers or assign them automatically—and more.

G L Plus expands your financial reporting capabilities, including changes in your financial position, offering even more flexibility for your General Ledger module. Typical reporting features include Budget/Prior Months Listing, Income Statements, Balance Sheets, Budget Variance Report, Comparative Reports, Source and Use of Funds.

Labels Plus offers a versatile label package that lets you maintain one or more mailing lists with up to 1,000 names each, as well as to access existing Vendor and Customer files easily; add, edit and delete names; sort and select; print mailing labels.

You won't find this kind of flexibility and sophistication in any other Apple II accounting system. To find out more, contact your Accounting Plus II dealer.

Software Dimensions Inc., 6341 Auburn Blvd., Citrus Heights, CA 95610. 916/722/8000

The Only Complete Document Proofreading System
For CP/M*, TRS-80* and IBM-PC Word Processors

PROOFREADER™

Featuring Random House® Dictionary

- Complete Accuracy-looks up every word; does not use less accurate root word analysis, plus Random House Dictionary
- Full Interactive Correction-standard
- Instant Access to Dictionary
- Compact-Random House Dictionary supplied in sizes to fit your system (50,000 words standard)

GRAMMATIK™

Beyond Spelling Checking

- Detects typos, punctuation and capitalization errors, misused words and phrases
- Analyzes Writing Style
- Suggests Alternative Usages

= NO ERRORS

"The programs together (Proofreader and Grammatik) offer a dynamic tool for comprehensive editing beyond spelling corrections."

—Dona Z. Meilach in Interface Age, 5 82

"Grammatik is the perfect complement to a spelling check program."

—Dr. Alan R. Miller in Interface Age, 5 82

"If you use a word processor and a spelling checker, then you should investigate the unique capabilities of this program. Grammatik is a surprisingly fast and easy to use tool for analyzing writing style and punctuation."

—Bob Loudon in InfoWorld, 12 81

"For the user who is as tight with his dollar as I, Proofreader is the program of choice."

—Stephen Kimmel in Creative Computing, 3 82

"Anyone involved with word processing in any way, whether writing manuals, letters, brochures, news copy, reports, etc. is encouraged to get the excellent program Grammatik."

—A.A. Wicks in Computronics, 6 82

Grammatik and Proofreader are compatible with all CP/M, MS-DOS (incl. IBM-PC), and TRS-80 word processors. Current CP/M formats: standard 8", Northstar, Omikron, Osborne, Apple. Please call/or write for details of minimum system sizes and availability of additional disk and operating system formats. Shipping costs included. Please specify your system configuration when ordering. Dealers inquiries invited

"There it is, Perkins, the most elementary particle of matter."

INTERNATIONAL SUMMER CONSUMER ELECTRONICS SHOW

June 6-9, 1982

McCormick Place, McCormick Inn
Conrad Hilton Hotel, Chicago

1982 NATIONAL COMPUTER CONFERENCE

JUNE 7-10 • ASTRODOMAIN
• HOUSTON, TEXAS

I was on the first flight in the morning of Tuesday, June 8 from Chicago to Houston. My seatmate, an engineer connected with the oil pipeline business, commented to me that after years of flying between Chicago and Houston, he had rarely seen a plane absolutely full.

I allowed that the full load was understandable since probably three quarters of the people on the flight were going from CES to NCC.

"CES. NCC. What are those?" he asked.

"Good question," said I and went on to explain about the two largest extravaganzas in the consumer electronics and computer industries.

CES is short for Consumer Electronics Show. It is held twice a year, the Winter CES the first week in January in Las Vegas, and the Summer CES the first week in June in Chicago. It is strictly an industry show; the general public is not allowed in. It's the place where manufacturers of hi-fi systems, video equipment, personal communications, security systems, telephones, video games, electronic games, wristwatches, calculators, and every other conceivable consumer electronic device come to display their wares.

The audience (show attendees) are principally buyers for department stores, chains, and independent dealers. Also other manufacturers attend to see what the competition is up to and, of course, the press is there en masse to see what's new and report on it for their respective audiences.

David H. Ahl

CES sprawls over three floors of the McCormick Place Exhibition Center as well as acres of pavement outside (for the satellite antenna systems and dishes) and spills over into two hotels. The booths are lavish and spectacular with many covering as much as 2000 square feet. Those on the main floor are often two-story affairs with private lounges on the second floor, well stocked with refreshments, for closing the big deals.

Every effort is made to woo the dealer, particularly in hotly competitive areas such as video game cartridges, component hi-fi systems, and auto sound systems. Activision, for example, sponsored an elaborate party with a jungle theme to

introduce their new Atari video cartridges. Jensen sponsored a paddle wheel cruise on Lake Michigan to show off their new auto sound speakers. On any given evening of the show, at least twenty-five receptions are being held simultaneously.

Unlike a consumer show where the products displayed are all available, CES is a place for trial balloons. Frequently, manufacturers will show prototype products. If they get enough orders, the item goes into production. On the other hand, if demand is soft, the product may never see the light of day. For example, three years ago five video game systems were shown at CES but only one of them, the Atari VCS, ever made it to marketing a major way. At each succeeding CES, various Hong Kong and Japanese companies have shown programmable game units for private labelling. One, the Radofin was picked up by a discount store chain to sell under their brand name, but it never really got off the ground. This year, however, a resurgence of interest in video game units was evident with major manufacturers such as Coleco jumping into the fray. By Christmas, there will be six competing units on the market: the Atari VCS, the Atari 5200 (a 400 computer system without a keyboard), Mattel Intellivision, NAP, Odyssey 2, Colecovision, and systems from Emerson and Tyrom (the makers of the Omar backgammon and chess computers).

There were only three new computers at CES, the Panasonic JR-200, NEC PC

Manufacturers show off their wares at two extravaganzas

CES/NCC continued...

6000 and Sinclair Spectrum. Several Japanese manufacturers were showing computers that had been shown at previous CES shows but for which there was not sufficient demand to bring them to market. We are assured now, though, that Casio, Quasar, and Toshiba will all have new units on the market by year end.

Speaking of computers, why should the NCC (National Computer Conference) be scheduled the same week as CES? Simply because five years ago when these shows were scheduled no one forecast that computers would be a consumer item and that there would be any overlap in exhibitors or audience for the two shows. Today, we know better, but unfortunately, many manufacturers had to make a hard decision as to which show to exhibit in. Some, such as Commodore, Texas Instruments, Toshiba and Panasonic elected to exhibit in both shows. Others such as Atari, Casio and Sinclair put all their marbles in CES. But the vast majority of computer manufacturers opted for NCC.

Like CES, NCC is also an industry show; the general public is not allowed in. Although a huge show with high attendance (over 90,000), NCC is far more sedate than CES. Although manufacturers spend big bucks displaying their hardware to best advantage, they tend to do it without the aid of Penthouse Pets, Playboy Bunnies, and other scantily clad females gracing their booths. NCC is also somewhat quieter than CES since there aren't scores of hi-fi manufacturers vying with each other to show off zillion watt amplifiers or earth shaking woofers.

Inevitably at every press reception or meeting in the press room the first question asked is, "what did you see that's new?" That's what we are going to try to answer for you, albeit somewhat briefly, in the space below. We can't begin to describe all of the new products of the over 600 manufacturers represented at the two shows. However, we have tried to select some of the most significant new introductions, the most interesting, and some novel and unexpected entries.

Among my colleagues, there was general consensus that this was the year of the video game at CES. I counted 16 separate manufacturers making cartridges for the Atari VCS and six making other systems or cartridges. This growth is staggering from the three manufacturers that existed a year ago.

NCC was unquestionably dominated by microcomputers and more specifically, small business systems. There were at least four Osborne clones, two Apple clones and scores of TRS-80 Model III look-a-likes.

And now, join us for a tour of these shows and some of the new products displayed.

COMPUTERS

Epson Compact Computer

A notebook-sized computer that runs on internal batteries for up to 50 hours with power and features comparable to many desktop computers was introduced by Epson America.

Called the HX-20, the computer features 16K RAM expandable to 32K, and 32K ROM expandable to 64K with an optional expansion unit. Other features include RS-232C and serial interfaces, a full-size ASCII keyboard, a built-in 24-column dot matrix printer with bit addressable graphics capabilities, an LCD virtual screen with a 20 x 4 character display and virtual width to 255 characters available by Basic "width" command, and tone generation.

The HX-20 uses an extended version of Microsoft Basic and has internal time, date and alarm string functions. Optional interfaces include a barcode reader, audio cassette, and systems bus for expanded capabilities. A microcassette and ROM cartridge are also available.

Epson America, Inc., 3415 Kashiwa St., Torrance, CA 90505. (213) 539-9140.

CIRCLE 340 ON READER SERVICE CARD

Cromemco CP/M System

Cromemco, Inc., announced the C-10 personal computer system. It uses a Z-80A microprocessor operating at 4MHz with 64K of RAM, and has a 25 line by 80 character graphics display on a 12" green phosphor CRT.

The C-10 Super Pak system also includes a double sided, double density disk drive, a detachable keyboard, RS-232 serial and parallel ports, and an RS-232 modem port with full handshake capability and an array of software packages. The software packages include a CP/M compatible operating system, Structured Basic, as a word processing package and a spread-sheet calculator program. \$785.

Cromemco also offers the pieces as separate items. The C-10 personal com-

puter itself, is \$995. The model CKBA keyboard is \$195, the model CST ergonomic stand, \$195; the 309 Kb model CFD floppy disk drive, \$595; and the model CLQ letter-quality printer, \$895.

The use of double sided, double density 5 1/4" floppy disk drives gives the C-10 drives 390 kilobytes of storage per drive. The C-10 is also upwardly software compatible with other Cromemco computers, including the System One, System Two and System Three series. All programs that can run under the CP/M or CDOS operating systems can also be run under Cromix, Cromemco's proprietary version of Unix. If a piece of software is written in Cromemco's Structured Basic language, the program created on the C-10 can run on Cromemco's 16/32-bit Motorola 68000 microprocessor-based CPU board, the DPU. In addition to the Structured Basic included with the Super Pak and word processing packages, high-level languages such as Fortran, rational Fortran, and Cobol are available.

Cromemco, Inc., 280 Bernardo Ave., Mountain View, CA 94043. (415) 964-7400.

CIRCLE 341 ON READER SERVICE CARD

Wang Professional Computer

Wang Laboratories, Inc. introduced the Wang Professional Computer. It includes a 16-bit professional computing system, the ability to function as a workstation on any Wang 2200, Virtual Storage (VS), Office Information System (OIS), or Alliance system, and more communications options. The Wang Professional Computer can run in stand-alone mode, through coaxial cable to other Wang products, over phone lines to Wang and non-Wang products, and through Wang-Net, Wang's local area network.

Other features include Microsoft's Disk Operating System (MS-DOS), which is enhanced by Wang, and optional CP/M 80 operating system emulation, and Wang's PC-Word Processing.

The Wang Professional Computer is a highly modular system. It can be configured as the basic "off-the-shelf" system with the electronics enclosure and detachable keyboard, or it can be expanded into

more powerful configurations with optional displays or home TV connection, printers, and diskette or Winchester disk storage devices.

The Base System Unit, Model PC001, contains the electronic enclosure with 128K memory, a 320K disk drive low-profile keyboard, MS-DOS operating system, and Basic interpreter.

Four Standard configurations are available. The Wang Professional Computer Base System Unit (Model PC001) costs \$2695. Other units are priced to \$8945.

Wang Laboratories, Inc., One Industrial Ave., Lowell, MA 01851. (617) 459-5000.

CIRCLE 342 ON READER SERVICE CARD

Innovative Unit from Grid

Grid Systems Corporation announced the portable Compass Computer which provides managers of corporations with the means of gathering information from colleagues and internal and external databases, the tools to analyze this information, and a way to report their results. It includes program development tools and applications programs that include text editing, graphics, a project management package, database management and an electronic spread sheet program, terminal emulators, and a network of supercomputers that extend the Compass Computer's range and power.

The compact 9 1/4 lb. Compass Computer is a portable workstation for a

corporate management information system, and both Grid Central and Compass Central are support computers backing up Compass Computer users.

A bit-mapped, flat-panel display measuring 4 3/4" x 3 1/2" can produce characters along with charts or graphs. A matrix density of 320 by 240 dots produces high-quality graphic images in amber which, according to recent studies, produces the least eye strain. For text-editing application, the screen can display as many as 24 lines and up to 70 proportionally spaced characters.

Wider data formats can be viewed by scrolling, which extends the width of the text to as many as 256 characters. When handling columnar data, as many as 256 columns of varying widths can be created. In this way, the left-to-right width for columnar documents such as spread sheets is virtually limitless on the Compass Computer. Base price \$8150.

Among the developmental tools included in the Compass Computer are five compatible languages (Microsoft-compatible Basic, Pascal, C, PL/M, and Fortran 77), an editor, and a macro assembler. The five applications packages are Gridfile, Gridplan, Gridplot, Gridwriter, and Gridpath.

Grid Systems Corporation, 2535 Garcia Ave., Mountain View, CA 94043. (415) 961-4800.

CIRCLE 343 ON READER SERVICE CARD

Micro Source Portable Unit

Micro Source Inc. introduced the M6000P portable microcomputer system. The standard system features the Z-80 CPU, 64K RAM, a standard keyboard with 83 keys, a 9" CRT with 80 character by 24 line video interface, and a CP/M 2.2 operating system. The system includes two double sided, double density, 5 1/4" disk drives. An 8-slot card cage can hold a wide variety of STD Bus circuit boards.

Micro Source Inc., 595 N. Clayton Rd., New Lebanon, OH 45345. (513) 687-1395.

Apple III CP/M Card

Apple Computer announced Softcard III, an Apple III Z80 board for CP/M capability. With the Apple Softcard III System, CP/M-based application programs join the Apple III library of software, which is based on the Apple III Sophisticated Operating System (SOS). The system supports the Apple 5-megabyte mass storage system, Profile, on which both SOS and CP/M files can be stored.

The Apple Softcard III System includes a plug-in Z80 microprocessor card, CP/M software, four manuals, and Microsoft Basic. The system requires a 128K Apple III personal computer with a suitable video display device. Optional peripheral devices include a compatible printer, external Apple Disk III drives or Profile hard-disk drive. \$450.

Apple Computer, Inc., 10260 Bandley Dr., Cupertino, CA 95014. (408) 996-1010.

CIRCLE 344 ON READER SERVICE CARD

Dynabyte Monarch

The Dynabyte Monarch is a multiuser computer system for concurrent processing of both 8 and 16-bit programs.

Monarch supports CP/M, MP/M II, CP/M-86, MP/M-86, Unix, Oasis-16 and Business Basic (Basic Four compatible). Monarch incorporates a single-board design without giving up expansion capabilities. Both the Multibus and S-100 bus are offered as optional internal card cages.

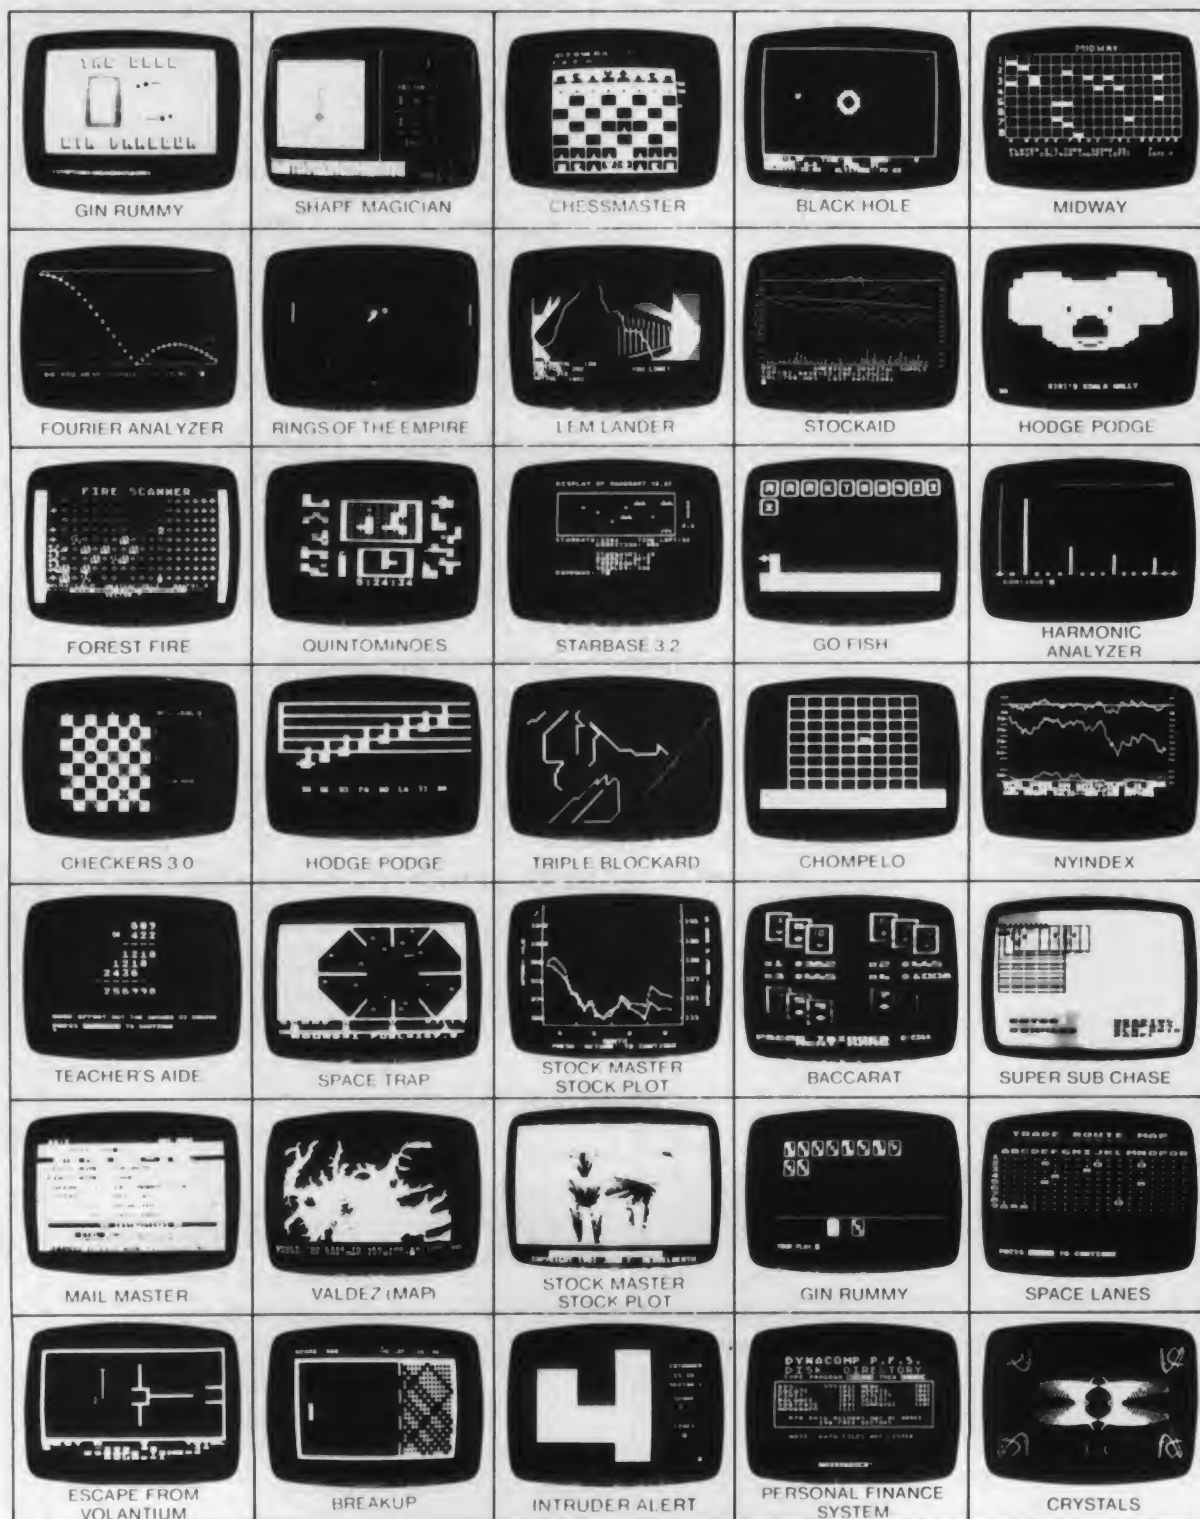

Monarch's Model 6600 standard configuration includes 256K RAM, 19Mb Winchester disk storage, nine RS-232 serial ports, one RS-422 high speed port, one parallel port, and an 8" IBM-compatible disk drive. \$10,995. Eight additional serial ports can be added, as well as up to 1 megabyte of memory in 256K increments. Monarch can expand to 76Mb and a 17Mb cartridge tape drive expansion unit. Error correction circuitry is also available.

Dynabyte, 521 Cottonwood Dr., Milpitas, CA 95035. (408) 263-1221.

CARD GAMES

BRIDGE MASTER (Available for all computers) Price: \$21.95 Diskette
If you liked DYNACOMP's BRIDGE 2.0, you will absolutely love BRIDGE MASTER. BRIDGE MASTER is a comprehensive bridge program designed to provide hours of challenging competition. Bidding features include the Blackwood convention, Stayman convention, pre-emptive openings, and recognition of demand bids and jump-shift responses. After playing a specific hand, you may replay the same hand, with the option of switching cards with your computer opponents. This feature allows you to compare your bidding and playing skills to BRIDGE MASTER. Bonus for game contracts and slams are awarded in duplicate format. Doubled contracts are scored based upon a computer assigned vulnerability. A score card is displayed at the conclusion of each hand. The score card displays a summary of total hands played, total points scored, number of contracts made and set, and % bids made. BRIDGE MASTER is clearly the best computer bridge program available.

DYNACOMP's previous BRIDGE 2.0 customers may upgrade to BRIDGE MASTER for a minimal charge of \$5.00 plus postage and handling (see ordering information box). Original cassette/diskette must be returned.

BACCARAT (Atari only) Price: \$18.95 Cassette/\$22.95 Diskette
This is the European card game which is the favorite of the Monte Carlo jet set. Imagine yourself at the gaming table with \$67 to your left and Goldfinger to your right. Learn and play BACCARAT on your leisure on the Atari. Contains full resolution color graphics and exciting sound. Runs in 16K. Requires one joystick.

GIN RUMMY (Apple diskette only) Price: \$22.95 Diskette
This is the best micro computer implementation of GIN RUMMY existing. The computer plays exceptionally well, and the HIREX graphics are superb. What else can be said?

POKER PARTY (Available for all computers) Price: \$19.95 Cassette/\$23.95 Diskette
POKER PARTY is a draw poker simulation based on the book, POKER, by Oswald Jacoby. This is the most comprehensive version available for microcomputers. The party consists of yourself and six other (computer) players. Each of these players will get to know them as a different personality in the form of a varying propensity to bluff and fold under pressure. Practice with POKER PARTY before going to that expensive game tonight! Apple cassette and diskette versions require a 32K (or larger) Apple II.

GO FISH (Available for all computers) Price: \$14.95 Cassette/\$18.95 Diskette
GO FISH is a classic children's card game. The opponent is a friendly computer with user inputs that are simple enough for small children to easily master. The Apple and Atari versions employ high resolution graphics for the display of hands. A most for children! Runs in 16K.

BLACKJACK COACH (32K TRS-80 only) Price: \$29.95 Cassette/\$33.95 Diskette
BLACKJACK COACH teaches and evaluates professional playing methods. This program will coach you using the Basic and the Complete Card Counting Methods. The BLACKJACK COACH uses an automatic, unattended play to test the playing and betting strategies you select. Extensive summary reports pinpoint the strengths and weaknesses of various methods of play. All the standard player choices are included: Insurance, splitting pairs, double down and surrender (optional). A new printer may be used to collect data. If you risk money at the tables, increase your skills with the BLACKJACK COACH.

THOUGHT PROVOKERS

MANAGEMENT SIMULATOR (Available for all computers) Price: \$25.95 Cassette/\$29.95 Diskette
This program is both an excellent teaching tool as well as an stimulating intellectual game. Based upon similar games played at graduate business schools, each player or team controls a company which manufactures three products. Each player attempts to outperform his competitors by selling, selling prices, production volumes, marketing and expense ratios etc. The most successful firm is the one with the highest stock price when the simulation ends.

FLIGHT SIMULATOR (Available for all computers) Price: \$19.95 Cassette/\$23.95 Diskette
A realistic and extensive mathematical simulation of take-off, flight and landing. The program utilizes aerodynamic equations and the characteristics of a real aircraft. You can practice instrument approaches and navigation using radials and compass headings. The most advanced flyer can also perform loops, half-loops and similar aerobatic maneuvers. Although this program does not employ graphics, it is exciting and very addictive. See the software review in COMPUTRONICS. Runs in 16K Atari.

VALDEZ (Available for all computers) Price: \$17.95 Cassette/\$21.95 Diskette
VALDEZ is a computer simulation of upriver navigation in the Prince William Sound/Valdez Narrows region of Alaska. Included in this simulation is a realistic and extensive map, an upriver map, and a map of which may be viewed using the ship's alphanumeric radar display. The motion of the ship itself is accurately modeled mathematically. The simulation also contains a model for the tidal pattern in the region, as well as other local (outgoing tankers and drifting icebergs). Chart your course from the Gulf of Alaska to Valdez Harbor! See the software reviews in NO Software Critique, Personal Computing and Creative Computing.

BACKGAMMON 2.0 (Available for all computers) Price: \$19.95 Cassette/\$23.95 Diskette
This program tests your backgammon skills and will also improve your game. A human can compete against a computer or against another human. The computer can even play against itself. Either the human or the computer can double or generate dice rolls. Board positions can be created or saved for replay. BACKGAMMON 2.0 plays in accordance with the official rules of backgammon and is sure to provide many fascinating sessions of backgammon play.

FROG MASTER (Atari only) Price: \$17.95 Cassette/\$21.95 Diskette
The Atari APFEX first prize winner, FROG MASTER contains exciting arcade features in addition to being a highly educational program. It is a strategy, not a reaction game. You score by making touch-downs on the opponents' goal line if his goalie doesn't get there first. But your players (tadpoles and frogs) must be trained. This is accomplished by giving them a reward at just the right moment when they do something right. This takes precise timing and judgment. Your critter penetrates barriers and avoid evil traps (if they are so lucky). Move them by the wayout, but some will get you through. As they learn you can look inside their heads to see how they think. As you learn them, they reward you (the "thought processes" simulated). As you teach them they teach you how learning takes place! Great graphics! Runs in 16K. Requires two joysticks.

FOREST FIRE (Atari only) Price: \$14.95 Cassette/\$18.95 Diskette
Using excellent graphics and sound effects, this simulation puts you in the middle of a forest fire. Your job is to direct operations to put out the fire while compensating for changes in wind, weather and terrain. Not pretentious valuable structures can result in startling penalties. Life-like variations are provided to make FOREST FIRE very comprehensive and challenging. No two games have the same setting and there are 3 levels of difficulty.

CRANSTON MANOR ADVENTURE (North Star, SuperBrain and CP/M only) Price: \$19.95 Diskette
At last! A comprehensive Adventure game for North Star and CP/M systems. CRANSTON MANOR ADVENTURE takes you into mysterious CRANSTON MANOR where you attempt to gather fabulous treasures. Lurking in the manor are wild animals and robots who will not give up the treasures without a fight. The number of rooms is greater and the associated descriptions are much more elaborate than the current popular series of Adventure programs, making this game the top in its class. Play can be stopped at any time and the status stored on diskette.

SPACE EVACUATION (Available for all computers) Price: \$15.95 Cassette/\$19.95 Diskette
Can you colonize the galaxy and evacuate the Earth before the sun explodes? Your computer becomes the ship's computer as you explore the universe to relocate millions of people. This simulation is particularly interesting as it combines many of the exciting elements of classic space games with the mystery challenge of ADVENTURE.

MONARCH (Atari only) Price: \$14.95 Cassette/\$18.95 Diskette
MONARCH is a fascinating economic simulation requiring you to survive as a Byzantine emperor as your nation's leader. You determine the amount of acreage devoted to industrial and agricultural use, how much to distribute to the populace and how much should be spent on pollution control. You will find that all decisions involve a compromise and that it is not easy to make everyone happy. Runs in 16K Atari.

RUBIK'S CUBE SOLVER (Available for all computers) Price: \$14.95 Cassette/\$18.95 Diskette/\$14.95 Disk
Rubik's Cube Solver is a computer program that solves the 3x3x3 Rubik's Cube. It is a "solver" for computer calculation. The RUBIK'S CUBE SOLVER permits you to input the starting state of the 24 face elements of the cube. It then solves the problem one step at a time, with each step shown as a unfolded view of the cube. Can you solve the cube in fewer steps. In any case, it can save hours of disassembling the cube or peeling off and replacing the colored Rubik's 16K.

AVAILABILITY

DYNACOMP software is supplied with complete documentation containing clear explanations and examples. Unless otherwise specified, all programs will run within 16K program memory space (ATARI requires 24K). Except where noted, programs are available on ATARI, PET, TRS-80 (Level II), NEC and Apple (Apple II) cassette and diskette as well as North Star single density (double density compatible) diskette. Additionally, most programs can be obtained on standard IBM 3740 single density (double density compatible format) 8" CP/M floppy disks for systems running under MBASIC or CBASIC (for example, Altos, Xerox 820, Heath, Zenith and many others). 5 1/4" CP/M diskettes are available for the North Star, SuperBrain and Osborne computer systems.

*ATARI PET-CBM, NORTH STAR, CP/M, IBM, OSBORNE, SUPERBRAIN, NEC PC-8000 and XEROX are registered trademarks and/or trademarks.

**Except where noted, all TRS-80 Model II software is available on cassette (only) for the TRS-80 Model III. Exceptions: VALDEZ, CRIBBAGE, GRAFIX, CHESSMASTER. TRS-80 diskettes are not supplied with either DOS or BASIC.

***For most North Star hardware systems.

****For Altos systems having Microsoft BASIC.

*****For SUPERBRAIN systems running under MBASIC or CBASIC (note syntax).

- Toll free order phone

*\$2.00 U.S. funds for foreign mailing

AND MORE...

STARBASE 3.2 (Available for all computers) Price: \$13.95 Cassette/\$17.95 Diskette
This is the classic space simulation, but with several new features. For example, the Croydon now shoot at the Invincible without warning while also attacking warships in other quadrants. The Croydon also attack with light and heavy cruisers and never when shot at. The situation is hectic when the Invincible is besieged by these heavy cruisers and a starbase S.O.S. is received! The Croydon get even! See the software reviews in A.N.A.L.O.G., 80 Software Critique and Game Merchandising.

LIL' MEN FROM MARS (Atari only) Price: \$19.95 Cassette/\$23.95 Diskette
Defend yourself! The little men from Mars are not to get you if you don't get them first. This is a hilarious high resolution animated graphics (arcade) game which exercises much of the Atari's power. Requires one joystick.

ALVIN (Atari only) Price: \$17.95 Cassette/\$21.95 Diskette
ALVIN is a great arcade game. You are commanding a highly maneuverable ship seeking to destroy several enemy cities. You are attempting to bomb these cities while at the same time trying to avoid their defensive fire (MISSILE COMMAND in reverse?). Also, your radar has been damaged so that you can only see downwards. This would normally not be much of a problem except that you also have to contend with high-flying enemy aircraft. As long as you are above these aircraft you have the advantage and are safe. However, high level bombing takes considerable skill. Therefore to achieve your goal the best strategy is to swoop down to a bombing run while the enemy craft is out of range, and quickly retreat to the skies. A fun game. Requires 16K.

ESCAPE FROM VOLANTINE (Atari only) Price: \$15.95 Cassette/\$19.95 Diskette
Bring the action and excitement of an arcade into your home with ESCAPE FROM VOLANTINE. To escape you must maneuver your space ship around obstacles and laser blast the guardian (without being eaten). If he is killed with a direct shot (not just a jet lapped off), a door opens to the outside. However, the door does not stay open indefinitely. If you fail to escape in time, the door closes and a new guardian appears. Sometimes you can smash through the door by repeatedly chipping away at it. Other times it is impervious. At the higher levels of play more obstacles and guardians appear, adding to the excitement. Uses high resolution graphics and sound. Runs in 16K.

ALPHA FIGHTER (Atari only) Price: \$13.95 Cassette/\$17.95 Diskette
Two excellent graphics and action programs in one! ALPHA FIGHTER requires you to destroy the alien starships passing through your sector of the galaxy. ALPHA BASE is the path of an alien UFO invasion, let the UFO's get by and the game ends. Both games require the joystick and get progressively more difficult the higher you score! ALPHA FIGHTER will run on 16K systems.

THE RINGS OF THE EMPIRE (Atari only) Price: \$14.95 Cassette/\$18.95 Diskette
The empire has developed a new battle station protected by rotating rings of energy. Each time you blast through the rings and destroy the station, the empire develops a new station with more protective rings. This exciting game runs on 16K systems, employs extensive graphics and sound and can be played by one or two players.

INTRUDER ALERT (Atari only) Price: \$15.95 Cassette/\$19.95 Diskette
This is a fast paced graphics game which places you in the middle of the "Treasure" having just stolen its plans. The guards have been alerted and are on their way. You must find and enter your ship to escape with the plans. Five levels of difficulty are provided. INTRUDER ALERT requires a joystick and will run on 16K systems.

MIDWAY (Atari 32K only) Price: \$14.95 Cassette/\$18.95 Diskette
MIDWAY is an exciting extension of the game of Battleship. It mixes the challenges of strategy and chance. Your opponent can be another human or the computer. Color graphics and sound are both included. Runs in 16K.

GOLF PRO (Atari only) Price: \$17.95 Cassette/\$21.95 Diskette
Both realistic and beautiful graphics are joined together in GOLF PRO to produce the best golf simulation available. To really test the realism, the graphics should have a color TV that you can see the green of the fairway, the blue of the water hazards, and the white sand of the traps. You tee off with a wood, use your wedge in the sand trap, and putt on the green just as would be done on the course. Show off the Atari to your friends with GOLF PRO. Requires 16K and one joystick.

GAMES PACK I (Available for all computers) Price: \$14.95 Cassette/\$18.95 Diskette
GAMES PACK I contains the classic computer games of BLACKJACK, LUNAR LANDER, CRAPS, HORSESHOE, SWITCH and more. These games have been combined into one large program for ease in loading. They are individually accessed by a convenient menu. This collection is worth the price just for the DYNACOMP version of BLACKJACK.

GAMES PACK II (Available for all computers) Price: \$14.95 Cassette/\$18.95 Diskette
GAMES PACK II includes the games CRAZY EIGHTS, JOTTO, ACE-DOUCEY, LIFE, WUMPUIS and others. As with GAMES PACK I, all the games are loaded as one program and are called from a menu. You will particularly enjoy DYNACOMP's version of CRAZY EIGHTS. Why pay \$9.95 or more per program when you can buy a DYNACOMP collection for just \$14.95?

MOON PROBE (Available for all computers) Price: \$12.95 Cassette/\$16.95 Diskette
This is an extremely challenging "lunar lander" program. The user must drop from orbit to land at a predetermined target on the moon's surface. You control the thrust and orientation of your craft plus direct the rate of descent and approach angle. Runs in 16K Atari.

SPACE TRAP (Atari only, 16K) Price: \$14.95 Cassette/\$18.95 Diskette
This galactic "shoot 'em up" arcade game places you near a black hole. You control your spacecraft using the joystick and attempt to blast as many of the alien ships as possible before the black hole closes about you.

SUPER SUB CHASE (Atari only) Price: \$19.95 Cassette/\$23.95 Diskette
SUPER SUB CHASE simulates a search and destroy mission. Set your course and keep an eye on the sonar readings as you hunt for the hidden submarine. Set the depth charge explosion depth and watch them sink two targets. This is an addictive game which takes advantage of the Atari's graphics and sound capabilities. One or two players. Joystick is required.

TWO PLAYER GAMES

TWO PLAYER GAMES (Available for all computers; 32K disk/diskette only)
DYNACOMP has acquired the distribution rights to the best of Xerox's war games. These two-player games were originally written for the North Star computer, but have since been converted to play on all of the computers currently supported by DYNACOMP. Because our licensing and development costs were so low, DYNACOMP offers these programs (two to a diskette) for only \$19.95/diskette, \$23.95/disk. If you like war games, then this is a bargain you can't pass up.

Set #1: PANZER and BLITZKRIEG
PANZER
Date: 23 Nov. 1943 Place: Several miles west of Kiev, Russia. The Russians have just liberated Kiev and are moving quickly to reach the German forces which are preparing for a last desperate attempt to halt the Russian advance.
BLITZKRIEG
Date: Spring 1940 Place: Northern France. The German blitzkrieg in the east was complete. Germany had turned its attention to the westward. France has been penetrated the Ardennes and Meuse. The German army is now in the defense of the Aisne-Somme position, and the final collapse of the French armies in the south has all passed. And, now, the drive on Paris...

Set #2: STARSHIP TROOPERS and INVASION OF THE MUD PEOPLE
STARSHIP TROOPERS
Date: Farthest Century Place: Archipel planet of Shind. The first all-out battle on the planet Shind which will match equal forces of Teron and alien units. The outcome will set the course of the conflict, for the planet of Shind is a key position in the solar war.
INVASION OF THE MUD PEOPLE
A Persian army battalion has been dispatched to a remote village area to investigate the destruction of many local dwellings and the disappearance of most of the villagers. Eye-witnesses have reported strange creatures appearing from acres of slimy mud holes which have suddenly begun forming across the terrain.

Set #3: FALL OF THE THIRD REICH and ARMORCAR
FALL OF THE THIRD REICH
Date: March, 1945 Place: Remagen, Germany. The allies under General Eisenhower had reached the Rhine. The Germans had failed in destroying the Ludendorff railway bridge, allowing several allied divisions to cross before it finally collapsed on March 17... and so, the allies began their drive on Berlin.
ARMORCAR
Date: 2 Feb. 1944 Place: Minsk, Russia. A German front-line unit is hard pressed for radio equipment and medical supplies. A relief convoy of armored cars must reach them through partisan-infested territory.

Set #4: MOUNT SUBIBACHI and MIDDLE EARTH
MOUNT SUBIBACHI
Date: 16 Feb. 1945 Place: Two Jima. The Japanese opened fire from Mount Subibachi on the marines landed on the perimeter-shaped island. Gunfire from the hill could cover the entire island, but it was a critical objective if the Americans were to capture and utilize the all-important air field. Mount Subibachi proved to be one of the most strongly defended positions in the Japanese theatre of war.

MIDDLE EARTH
Date: 1997 Place: MIDDLE EARTH. Through a maze of tunnels, caves, and rocky passageways discovered leading from an inactive volcano in South America, a team of United Nations' researchers have undertaken a mission to an uncharted frontier: the center of the Earth. After a perilous journey spanning a period of several months, the mission has arrived at the Earth's core, a land of flames, steam, and unforeseen vegetation. And there the creatures of MIDDLE EARTH appeared... unmatched by the most frightening horror stories created by man...

MISCELLANEOUS

CRYSTALS (Atari only) Price: \$14.95 Cassette/\$18.95 Diskette
A unique algorithm randomly produces fascinating graphics displays accompanied with tones which vary as the patterns are built. No two patterns are the same, and the combined effect of the sound and graphics are mesmerizing. CRYSTALS has been used in local stores to demonstrate the sound and color features of the Atari. Runs in 16K.

NORTH STAR SOFTWARE EXCHANGE (NSSE) LIBRARY
DYNACOMP now distributes the 23 titles in the NSSE Library. These diskettes each contain many programs and offer an outstanding value for the purchase price. They should be part of every North Star user's collection. Call or write DYNACOMP for details regarding the contents of the NSSE collection. Price: \$9.95 each \$8.95 each (4 or more). The complete collection may be purchased for \$159.95.

5 1/4" DISKETTES (soft sector/ten sector) Price: \$39.95/20 Diskettes
As you may imagine, DYNACOMP purchases diskettes in large quantities and at wholesale prices. We want to pass the savings along to you!

BUSINESS and UTILITIES

- PORTFOLIO MANAGEMENT (Apple only)** Price: \$69.95 two Diskettes
The PORTFOLIO MANAGEMENT package was written by a stock broker to help manage portfolios for individual customers. With this program data files can be easily created and kept up to date. A variety of reports can be generated for clients which are easy to read and understand. The user may define his own investment categories. PORTFOLIO MANAGEMENT is a top quality, professional tool which will not only provide you with new conveniences but will also serve to enhance your appearance as an efficient and up to date advisor to your clients. Comes complete on two diskettes along with a 30 page instruction manual.
- PERSONAL FINANCE SYSTEM (Available for all computers)** Price: \$39.95 Diskette
PFS is a single diskette, menu-oriented system composed of ten different programs. Besides recording your expenses and tax deductible items, PFS will sort and summarize expenses by date, and display information on expenditures by any of 26 user defined codes by month or by payee. PFS will even produce monthly bar graphs of your expenses by category. This powerful package requires only one disk drive, minimal memory (24K Atari, 32K North Star) and will store up to 600 records per disk (and over 1000 records per disk by making a few simple changes to the program). You can record checks plus cash expenses so that you can finally use where your money goes and eliminate guesswork and tedious hand calculations. Contains high speed machine language sort. PFS has been demonstrated on network (CBS) TV.
- FAMILY BUDGET (Apple and Atari only)** Price: \$34.95 Diskette
FAMILY BUDGET is a very convenient financial record-keeping program. You will be able to keep track of cash and credit expenditures as well as income on a daily basis. You can record tax deductible items and charitable donations. FAMILY BUDGET also provides a continuous record of all credit and debit transactions. The program automatically calculates entries to any of 21 different expense accounts as well as 5 payroll and tax accounts. Data are easily retrieved giving the user complete control over an otherwise complicated (and unorganized) subject.
- TEXT MASTER (Apple 32K, diskette only)** Price: \$49.95 Diskette
TEXT MASTER is a general purpose text editor for the Apple II computer. It features powerful, English-oriented commands which permit the complete manipulation of textual information. Information treated may be correspondence, computer programs, data to be used by other programs, and more. TEXT MASTER also interfaces with any printer connected to your Apple. The minimum system requirements are 32K of RAM, AppleSoft on ROM, at least one disk, and a lower case adapter. TEXT MASTER can store and retrieve files by segment. Thus it is possible to process files as large as a diskette. Comes complete with an efficient 16 page manual. TEXT MASTER is equivalent in capability to many word processing systems costing \$3 or more in price. The commands available in TEXT MASTER are: COLLECT, USE, EXECUTE, NOWIN, INSURE, JUMP, RETURN, DELETE, SAVE, COPY, FREE, REPLACE, WAIT, MOVE, LENGTH, LIST, RE-SAVE, CLEAR, AUTO, RETRY, APPEND, SET, MANUAL, CHANGE, SCRATCH, SHOW, CATALOG, MODIFY, COMPARE, NOWIN, DISPLAY, HELP.
- INTELINK (Atari only)** Price: \$49.95 Diskette
This software package contains a menu-driven collection of programs for facilitating efficient two-way communications through a full duplex modem (required for use). In one mode of operation you may connect to a data service (e.g., the SOURCE or MicroNet) and quickly load data such as stock quotations into your diskette for later viewing. This greatly reduces "connect time" and thus the service charge. You may also record the complete contents of a communications session. Additionally, programs written in BASIC, FORTRAN, etc. may be built either using the support text editor and later "uploaded" to another computer, making the Atari a very smart terminal. Even Atari BASIC programs may be uploaded. Further, a command file may be built off-line and used later as controlling input for a time-share system. That is, you can set up your sequence of time-share commands and programs, and the Atari will transmit them as needed, batch processing. All this adds up to saving both connect time and your time.
- PAYFIVE (Apple II plus diskette, two drives required)** Price: \$149.95
This is an enormously flexible employee payroll system with extraordinarily good human engineering features. PAYFIVE prints checks and compiles the required federal, state and local forms for up to 148 employees. The pay methods by hourly, salary, commission or any combination. There are multiple options for pay periods, and they also can be used in any combination. PAYFIVE includes many other features and comes extremely well documented with a 200 page manual. The manual may be purchased separately for \$30, and that payment later applied to the software purchase.
- SHOPPING LIST (Atari only)** Price: \$12.95 Cassette/\$16.95 Diskette
SHOPPING LIST stores information on items you purchase at the supermarket. Before going shopping, it will remind you of all the things you might need, and then display for optionally printed your shopping list and the total cost. Adding, deleting, changing and storing data is very easy. Runs with 16K.
- TAX OPTIMIZER (Available for all computers)** Price: \$59.95 Diskette
The TAX OPTIMIZER is an advanced software package which provides the user with a powerful tool for analyzing various income tax strategies. The program is designed to provide a quick and easy data entry. Income tax is computed by all tax methods (regular, income averaging, maximum and alternate minimum tax). The user may immediately observe the tax effects of various deductions and credits. TAX OPTIMIZER has been thoroughly field tested in CPA offices and comes complete with the current tax tables in its data files. TAX OPTIMIZER is tax deductible!
- STOCK MASTER/STOCK PORT (Apple 48K)** Price: \$59.95 Diskette
This is a full-featured stock portfolio management and analysis system. Ten years of records on up to thirty stocks may be maintained. You may record prices, returns, earnings/share, ROE, quarterly earnings and dividends, transactions, long/short term gains, P/E, income, NASDAQ and MORE. You may print DIBSE (the price history of any stock against any other time, or the index). Portfolio value may be evaluated at any time. Comes complete with superbly written instructions and sample files on a second diskette.
- TURKEY AND MENU (Atari only)** Price: \$17.95 Diskette
TURNKEY is a utility program which allows you to create autoboot/autorun diskettes easily. Simply load and run TURKEY, load the program diskette to be modified, and answer the questions! The TURKEY diskette also comes with DOS 2.0 and includes another program, MENU. MENU lists the contents of your diskette alphabetically, and permits the running of any BASIC program on the diskette by typing a single key. TURKEY and MENU provide you with the ability to run any program on your diskette by simply turning on the computer and pressing a single key.
- STOCKAID (Atari only)** Price: \$29.95 Diskette
STOCKAID provides a powerful set of tools for stock market analysis. With STOCKAID you can display point and figure charts, as well as bar charts with oscillators. You can also examine long term moving averages and on-balance volume features. STOCKAID allows you to input daily data with a single diskette storage capability of 239 days x 16 months. Included are stock dividend and split adjustment capabilities. A very professional package!
- NYINDEX (Atari only)** Price: \$29.95 Diskette
NYINDEX is a comprehensive software package for storing, retrieving and plotting New York Stock Exchange information. The daily data treated includes the composite index, advances, declines, new highs and new lows. Graphical displays include the above plus the index oscillator, cumulative advances/declines and moving averages. Data entry and editing is easy. The diskette includes more than two years of daily data. NYINDEX is an excellent companion to STOCKAID.
- PLAYER-MISSILE GRAPHICS TABLET (Atari only)** Price: \$19.95 Diskette
The PLAYER-MISSILE GRAPHICS TABLET was designed to take the drudgery out of developing four color displays in GRAPHICS MODE 7. No longer will you have to read the locations of those tiny blocks on your graph paper and calculate PLOTs and DRAWTOs. With PMP you will be able to easily design colorful graphic displays with your joystick and save them on diskette for later recall.
- LIFE CYCLE ANALYSIS AND DEPRECIATION (Apple diskette only)** Price: \$39.95 Diskette
This software package creates a data file of business expenses for equipment which can later be used to calculate and display a variety of reports. You may project annual costs, but the present worth, create depreciation schedules and justify tax deductions. The evaluation techniques conform to standards set by federal agencies. This is an invaluable package for any businessman who has invested in equipment. LIFE CYCLE ANALYSIS features an easy to use data file creation screen and provides formatted hardcopy reports for use in presentations or for tax record keeping purposes. When used for generating tax information, this package is tax deductible! Requires 48K. Comes on two diskettes.
- MICROMAGIC (Apple diskette only)** Price: \$39.95 Diskette
The emphasis of this program is clearly the MAGIC MICROMAGIC offers outstanding versatility in its ability to function as a stand alone entertainment package or as a utility program to create stunning animated graphics for use in other programs. The screen graphics are special on screen graphics editor. You control a graphics cursor directly from the keyboard, creating high resolution images using all 16 available colors. When any one done with a picture, it can be saved on disk with a single key command. Up to 24 images can be saved as "frames" of a movie, and then played back at high speed to create truly animated movies. The effects are truly stunning. This package comes complete with demonstration programs so that even novice users can get immediate results. No programming skills are necessary to use MICROMAGIC. If you have been frustrated by the effort required to create graphics images with your computer, MICROMAGIC will delight you.
- SHAPE MAGICIAN (Apple II, 48K, diskette only)** Price: \$29.95
At last! An utility for painlessly creating graphics shapes for the Apple. Create, edit and save up to 30 shapes which can then be used to develop arcade games or to simply enhance your programs. Add that professional touch!

ORDERING INFORMATION

All orders are processed and shipped within 48 hours. Please enclose payment with order and include the appropriate computer information. If paying by VISA or MasterCard, include all numbers on card. Purchase orders accepted.

Shipping and Handling Charge: Delivery: All orders (including books) are sent First Class.

Within North America: Add \$2.00
Outside North America: Add 15% (Air Mail)

Quantity Discounts: Deduct 10% when ordering 3 or more programs; 20% when ordering 5 or more. Dealer discount schedules available upon request.

8" CP/M Disk: Add \$2.50 to the listed diskette price for each 8" floppy disk (IBM soft sectorized CP/M format). Programs run under Microsoft BASIC or BASIC-80.

5 1/4" CP/M Disk: All software available on 8" CP/M disks is also available on 5 1/4" disks. North Star, Osborne, Superbrain and NEC format.

Ask for DYNACOMP programs at your local software dealer. Write for detailed descriptions of these and other programs from DYNACOMP.

DYNACOMP, Inc. (Dept. C)

1427 Monroe Avenue
Rochester, New York 14618

(800) 828-6773
Office phone (9AM-5PM EST): (716) 442-8760
New York State residents please add 7% NY sales tax.

EDUCATION

- HODGE PODGE (Apple 48K only)** Price: \$14.95 Cassette/\$18.95 Diskette
Let HODGE PODGE be your child's teacher. Presenting any key on your Apple will result in a different and intriguing "happening" related to the letter or number of the chosen key. The program is graphics, color and sound are a delight for children ages 10 to 16. HODGE PODGE is a non-intimidating brain device which brings a new dimension to the use of computers in education. See the excellent reviews of this very popular program in ENVOI MAGAZINE and SOFT TALK.
- TEACHER'S AIDE (Atari and PET only)** Price: \$13.95 Cassette/\$17.95 Diskette
TEACHER'S AIDE consists of three basic modules contained in one program. The first module provides addition and subtraction exercises of varying levels of difficulty. The second module consists of multiplication problems in which the student may be tested either on the long hand or on the short hand answers. The third module contains division problems of varying levels of complexity are provided here as well. The third module contains division problems, one particularly nice feature of the division module is that the long hand division steps can be displayed along with the remainder in order to clearly demonstrate the procedure by which the remainder is derived. With TEACHER'S AIDE is not merely a drill, but rather a learning experience.

STATISTICS and ENGINEERING

- DIGITAL FILTER (Available for all computers)** Price: \$39.95 Cassette/\$41.95 Diskette
DIGITAL FILTER is a comprehensive data processing program which permits the user to design his own low-pass or high-pass filter or choose from a menu of filter forms. In the explicit design mode the shape of the frequency transfer function is specified by directly entering points along the desired filter form. In the menu mode, ideal low pass, high pass and bandpass filters may be approximated to a desired number of points and the resulting filter coefficients are calculated. The filter may optionally also be smoothed with a Hanning function. In addition, multi-stage Butterworth filters may be selected. Features of DIGITAL FILTER include plotting of the data before and after filtering, as well as display of the chosen filter functions. Also included are convenient data storage, retrieval and editing procedures.
- DATA SMOOTHER (Not available for Atari)** Price: \$19.95 Cassette/\$21.95 Diskette
This special data smoothing program may be used to rapidly derive smoothed data for use in statistical analysis and engineering data which are equally spaced. The software features choice in degree and range of fit, as well as smoothed first and second derivative calculation. Also included is automatic plotting of the input data and smoothed results.
- FOURIER ANALYZER (Available for all computers)** Price: \$19.95 Cassette/\$23.95 Diskette
This program is designed to analyze periodic data. The program permits the user to enter data points, plot the data and plotting of the input data and results. Practical applications include the analysis of complex patterns in such fields as electronics, communications and business.
- TFA (Transfer Function Analyzer)** Price: \$19.95/\$23.95 Diskette
This is a special software package which may be used to evaluate the transfer functions of systems such as hi-fi amplifiers and filters by examining their response to filtered inputs. TFA is a major modification of FOURIER ANALYZER and contains an engineering-oriented decimal wave frequency plot as well as data editing features. Whereas FOURIER ANALYZER is designed for educational and scientific use, TFA is an engineering tool. Available for all computers.
- HARMONIC ANALYZER (Available for all computers)** Price: \$24.95 Cassette/\$28.95 Diskette
HARMONIC ANALYZER is a program designed for spectrum analysis of repetitive waveforms. Features include data file generation, editing and storage/retrieval as well as data and spectrum plotting. One particularly unique facility is that the input data need not be equally spaced in order. The original data is stored and a cubic spline interpolation is used to create the data file required by the FFT algorithm.
- FOURIER ANALYZER, TFA and HARMONIC ANALYZER may be purchased together for a combined price of \$51.95 (three cassettes) and \$63.95 (three diskettes).**
- REGRESSION I (Available for all computers)** Price: \$19.95 Cassette/\$23.95 Diskette
REGRESSION I is a unique and exceptionally versatile one-dimensional least squares "polynomial" curve fitting program. Features include very high accuracy; automatic degree determination option; an extensive internal library of fitting functions; data editing; automatic data, curve and residual plotting; a statistical analysis of the data (deviation, correlation, coefficient, etc.) and much more. In addition, new fits may be tried without reentering the data. REGRESSION I is certainly the cornerstone program in any data analysis software library.
- REGRESSION II (Available for all computers)** Price: \$19.95 Cassette/\$23.95 Diskette
PARABIT is designed to handle the parameters of a parabola in the form of a parabola in the fitting function. The user simply inputs the functional form, including the parameters (A(1), A(2), etc.) as one or more BASIC statement lines. Data, results and residuals may be manipulated and plotted as with REGRESSION I. Use REGRESSION I for polynomial fitting and PARABIT for these complicated functions.
- MULTILINEAR REGRESSION (MLR) (Available for all computers)** Price: \$24.95 Cassette/\$28.95 Diskette
MLR is a professional software package for analyzing data sets containing two or more linear relationships. Besides performing the basic regression calculation, this program also provides easy access to data entry, storage, retrieval and editing functions. In addition, the user may interrogate the solution by supplying values for the independent variables. The number of variables and data size is limited only by the available memory.
- REGRESSION I, II and MULTILINEAR REGRESSION may be purchased together for \$51.95 (three cassettes) or \$63.95 (three diskettes).**
- ANOVA (Not available on Atari cassette or for PET/CBM)** Price: \$39.95 Cassette/\$43.95 Diskette
In the past the ANOVA (analysis of variance) procedure has been limited to the large mainframe computers. Now DYNACOMP has brought ANOVA to small systems. For those conversant with the large mainframe, DYNACOMP software package includes the 1-way, 2-way and N-way procedures. Also provided are the Yates 2² factorial designs. For those unfamiliar with ANOVA, do not worry. The accompanying documentation was written in a simple and fashion by a person in the field of statistics as well as an experienced programmer. The ANOVA is a support program for building the data base. Included are several convenient features including data editing, deleting and appending.
- BASIC SCIENTIFIC SUBROUTINES, Volumes 1 and 2 (Not available for Atari)**
DYNACOMP is the exclusive distributor for the software listed in the popular text, BASIC SCIENTIFIC SUBROUTINES, Volumes 1 and 2 by F. R. Burdick. These two volumes contain a total of 100 subroutines for use in a standard according to chapter, included with each collection is a menu program which selects and demonstrates each subroutine.
- Volume 1
Collection #1: Chapters 2 and 3 - Data and function plotting, complex variables and functions.
Collection #2: Chapter 4 - Extended matrix and vector operations.
Collection #3: Chapters 5 and 6 - Random number generators (Poisson, Gaussian, etc.), series approximations.
Price per collection: \$16.95 Cassette/\$20.95 Diskette
All three collections are available for \$44.95 (three cassettes) and \$53.95 (three diskettes).
- Volume 2
Collection #1: Chapter 1 - Linear, polynomial, multidimensional, parametric least squares.
Collection #2: Chapter 2 - Fourier approximation techniques (interpolation, inversion, reversion, shifting, etc.)
Collection #3: Chapter 3 - Functional approximations by iteration and recursion.
Collection #4: Chapter 4 - CORDIC calculations for trigonometric, hyperbolic, exponential and logarithmic functions.
Collection #5: Chapter 5 - Table interpolation, differentiation and integration (Newton, Lagrange, splines).
Collection #6: Chapter 6 - Methods for finding the real roots of functions.
Collection #7: Chapter 7 - Methods for finding the complex roots of functions.
Collection #8: Chapter 8 - Optimization by steepest descent.
Price per collection: \$18.95 Cassette/\$22.95 Diskette
All eight collections are available for \$99.95 (eight cassettes) and \$129.95 (eight diskettes).
Because the texts are a vital part of the presentation, BASIC SCIENTIFIC SUBROUTINES, Volumes 1 and 2 are available from DYNACOMP.
- BASIC SCIENTIFIC SUBROUTINES, Vol. 1 (319 pages) \$19.95 + 75¢ postage
BASIC SCIENTIFIC SUBROUTINES, Vol. 2 (790 pages) \$23.95 + \$1.50 postage
See reviews in KILBOLD, Dr. Dobbs, and ACCESS.

- SOFTNET (Apple II and TRS-80 48K diskette only)** Price: \$129.95
SOFTNET is a powerful software package which permits the user to evaluate their flow performance. Up to 150 nodes with up to 150 connecting elements may be simulated, and models may be combined to form yet larger models. If you are involved in water distribution systems, chemical fluid flow problems, building plumbing, or similar situations, this is an ideal analysis package.
- FILTER ANALYSIS (Apple only)** Price: \$19.95 Cassette/\$23.95 Diskette
FILTER ANALYSIS is the ideal program for determining the frequency response of passive filters. Any number of RLC components may be included, and any number of poles treated. FILTER ANALYSIS features its own micro-graphics which makes circuit description simple. Results may be printed in tabular form or plotted in HIRSH-like graphs (decibel versus log-frequency).
- ACTIVE CIRCUIT ANALYSIS (Available for all computers)** Price: \$35.95 Cassette/\$39.95 Diskette
With ACAP you may analyze the response of an active or passive component circuit. The circuit may be posed as equal or unequal to frequency, and the resulting complex voltages at each component node are examined. The frequency response of a filter or amplifier may be completely determined with respect to both amplitude and phase. In addition, ACAP prints a statistical analysis of the range of voltage responses which result from tolerance variations in the components. ACAP is easy to learn and use. Circuit descriptions may be saved onto cassette or diskette to be recalled at a later time for execution or editing. ACAP should be part of every circuit designer's program library. Requires 48K.
- LOGIC SIMULATOR (Available for all computers)** Price: \$35.95 Cassette/\$39.95 Diskette
Test your complicated digital logic designs in given set of inputs to determine how your logic will operate. The elements which may be simulated include multiple input AND, OR, NOR, EXOR, EXNOR and NAND gates, as well as inverters, J-K and D flip-flops, and one-shots. Inputs may be checked with varying clock cycle lengths/durations and delays, and the results may be printed or plotted. A unique feature of LOGIC SIMULATOR is any given set of nodes may be plotted. Save your breadboard design until the circuit is checked by LOGIC SIMULATOR. Requires 48K.
- BEAM DEFLECTION (Available for all computers) (disk/diskette only)** Price: \$29.95 Diskette/\$32.45 Disk
BEAM DEFLECTION is the first in DYNACOMP's new series of structural analysis software packages. It consists of two programs. The first program permits the development of a data file which describes the beam, the material, the ends of the beam may be pinned, clamped or free. The beam may be uniformly supported by an elastic bed, or held up by springs vertically placed and having different spring constants. The elasticity and cross section of the beam may vary along its length. The load may be uniformly distributed or may include discrete loads. The beam may be pinned at various points along its length. And so on. All this information may be easily entered and edited using the data input program.
- Following this the analysis program is called. The calculated results are the stress and deflections of the beam, both in numerical and graphic form. Once the input data is saved, cases may be easily rerun with modification, thereby permitting iterative design.
- The documentation which comes with BEAM DEFLECTION clearly shows how to use the software. In addition, three test problems are described and demonstrated so that you understand how to use the program. Also, helpful theoretical information is supplied in the appendix.

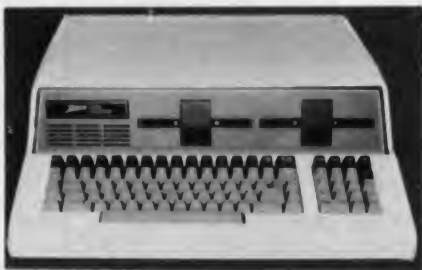

- STATIST (Not available on Atari cassette or for PET/CBM)** Price: \$19.95 Cassette/\$23.95 Diskette
This is a statistical inference package which helps you make wise decisions in the face of uncertainty. In an interactive fashion you can build and edit data files and test the differences in means, variances and proportions. STATIST will also perform data analysis as well as do the least squares correlation and regression. This menu-driven statistical workhorse is rounded out with a chi-square contingency test and a (uniform and normal) random sample generator. The documentation is written by a college professor who guides you through the various tests.

ABOUT DYNACOMP

DYNACOMP is a leading distributor of small system software with sales spanning the world (currently in excess of 50 countries). During the past three years we have greatly enlarged the DYNACOMP product line, but have maintained and improved our high level of quality and customer support. The achievement in quality is apparent from our many repeat customers and the software reviews in such publications as COMPUTRINE, 80 Software Critique, A.N.A. Software, Softalk, Creative Computing and KILBOLD. DYNACOMP software has also been chosen for demonstration on network television. Our customer support is as close as your phone. It is always friendly. The staff is highly trained and always willing to discuss products or give advice.

Zenith Dual MPU Systems

Zenith Data Systems introduced the Z100 series of desktop computers which have as standard features both 8- and 16-bit microprocessors, a five-slot S-100 expansion chassis, two built-in 320K 5 1/4" diskette drives, 128K RAM, color graphics with control of eight colors and 144,000 dots, and keyboard in a single housing. Memory is expandable on all models to 768K.

The computers use the IEEE 696 expansion chassis (commonly called the S100 bus), which enables the use of a wide variety of S100 options.

Digital color or RGB output is standard on both versions of the Z100. The low-profile version also has monochrome composite video output.

It also uses CP/M on the 8-bit side of the computer, which makes transfer of 8-bit software to the Z100 possible, while Z-DOS and the diskette format of the Z100 make most software for the IBM personal computer available to the new Zenith computers. The retail price of a Z100 system including software is less than \$5000.

Zenith Data Systems, 1000 Milwaukee Ave., Glenview, IL 60025. (312) 391-8181.

CIRCLE 346 ON READER SERVICE CARD

Five from Commodore

The Commodore Max Machine is a three-in-one home computer/game machine/music synthesizer which includes an array of arcade games, educational and musical programs and peripherals. It has a 40-column x 25-line screen and 16 colors. The sound system produces three independent voices, each with a nine-octave range, contains a program-

mable ADSR generator and a programmable filter, and has variable resonance. \$179.95.

The Commodore 64 gives home and business users 64K computing capability along with "three-dimensional-style" color game graphics and music synthesis. The Commodore 64 can use VIC-20 peripherals and can also use many programs and files created for Commodore's line of PET

and CBM education- and business-oriented computers. It has a 40-column x 25-line screen and 16 colors, as well as 64K RAM. \$595.

The Commodore Information Network, is a user-oriented telecommunications service that allows home computerists to get technical assistance, exchange programming tips, access Commodore product information and play games. Users of Commodore's VIC-20 home computer can access the service with the VICmodem cartridge and a modular telephone. With the purchase of a VICmodem, Commodore provides a free one-year subscription to CompuServe, and one free hour of time on the CompuServe network.

Thirteen cartridge games—including three Bally/Midway arcade games—for the VIC-20 are now available. Commodore also has a complete range of peripheral products for the VIC, including a single disk drive, graphic printer, VICmodem, and 16K memory expansion cartridge. The Bally/Midway games are *Gorf*, *Omega Race*, and *Wizard of Wor*. Commodore's own *Space Vulture*, *Raid on Fort Knox* and *Pinball Spectacular* are also available, as are *Mole Attack* and *The Sky is Falling*, Commodore's children's cartridge games. The five Scott Adams adventures are also available.

Commodore also introduced the BX256 16-bit multiprocessor professional microcomputer, featuring 256K user memory (RAM), the BX256 is an enhanced version of Commodore's B series microcomputer and has two processors, including a 16-bit 8088 for CP/M-86. It also has an 80-column screen and built-in dual disk drives. It is expandable to a maximum of 256K RAM internally with 640K externally, and can accommodate an optional Z80 processor board. \$2995.

Commodore also has the B128 microcomputer which features 128K user memory (RAM), an attached 80-column screen and built-in dual drive. B series computers are expandable to a maximum of 256K RAM internally with potential for 640K

externally, and accommodate an optional Z80 processor board to provide CP/M compatibility. \$1695.

The P128 microcomputer is the third generation of the PET series. The P128, which connects directly to a television set monitor via built-in RF modulator, features 128K RAM, 40 columns by 25 lines display, and 16 colors for either text or graphics. The P128 also features a high resolution graphic display of 320 by 200 pixels. Storage in the P128 is expandable

to a maximum of 256K RAM internally and 640K externally. This third-generation machine also becomes a multi-processor system via a Commodore-designed Z80 processor board that offers CP/M compatibility. \$995.

A "Family" of "Easy" spreadsheet programs has also been introduced by Commodore. The four new programs, EasyCalc, EasyPlot, Easy Tools, and EasyScan, run on SuperPet and Commodore 64 micros. EasyCalc is \$149.95 for the SuperPet and \$99.95 for the Commodore 64. EasyPlot for the SuperPet is \$149.95 and \$99.95 for the Commodore 64. Commodore dealers have EasyTools for the SuperPet for \$124.95 and for the Commodore 64 for \$79.95. EasyScan is \$124.95 for the SuperPet and \$79.95 for the Commodore 64.

Commodore Business Machines, Inc., Computer Systems Division, The Meadows, 487 Devon Park Dr., Wayne, PA 19087. (215) 687-9750.

Lobo Personal Computer

Lobo Drives International introduced the MAX-80 personal computer.

The streamlined keyboard unit houses the 5 MHz Z80, 64K RAM, two RS-232C serial ports, a built-in Centronics-type parallel port, a buffered bus expansion connector, and built-in controllers for all standard floppy disk drives as well as a hard disk interface.

The MAX-80 supports two business-oriented operating systems—the TRSDOS-compatible LDOS and CP/M.

Standard 80 x 24, 64 x 16 and 16 x 32 video display modes are all software selectable, and both text and graphics characters are generated in user-accessible RAM. The 76-key keyboard with a numeric pad and four function keys also houses a real-time clock with self-charging backup battery. The complete MAX-80 keyboard unit is priced at \$800 and the high-resolution, green screen monitor is priced at \$150.

Lobo Drives International, 358 S. Fairview Ave., Goleta, CA 93117. (805) 683-1576.

Altos Network Systems

Altos Computer Systems announced a family of 16-bit microcomputers that are compatible with a variety of operating systems and business application software programs.

Based on the Intel 8086 microprocessor, the ACS8600 systems allow up to eight users to share up to a million bytes of main (RAM) memory, plus on line floppy Winchester hard disk storage of from 1 to 80 megabytes. They feature error detection and correction and a memory management system.

The basic system, with 512K RAM, 20Mb hard disk, and floppy disk backup, lists for \$12,500. The 40Mb system is also available with up to 80Mb possible using an upgrade kit. Mag tape cartridge (17Mb) backup is available too.

The family supports the Xenix operating system—Bell Lab's Unix, version 7 adapted by Microsoft—as well as CP/M-86, MP/M-86 and Oasis-6.

Languages supporting end user applications are Microsoft versions of Basic, Cobol, Pascal, and Fortran, as well as

Cis-Cobol, RM-Cobol, Pascal/M-86 and C-Basic-86.

In addition to eight terminals and peripherals, the system allows expansion through a Multibus port and accepts both synchronous (bisynd) and asynchronous (asyn) communications protocols. It can handle network data rates of up to 800 kilobaud for high speed networking.

A dual drive floppy disk controller contains one megabyte of storage on two single sided, double density disks. Eight-inch Winchester disks are available in 10Mb, and 40Mb capacities. Floppy disks for backup accept 500K on a single disk, and mag tape systems are available with higher capacities.

Altos also announced Ethernet computer networking capability for its 16-bit microcomputers, and an economical Altos-to-Altos high speed networking scheme called Altos-Net.

The networks implement Altos-Net/Unet networking software, running under the Xenix version of the Unix operating system. Because the two networking schemes—inter-Altos and Ethernet—share the same software, upgrading is possible.

Ethernet will permit the networking of up to 100 Altos 16-bit computers, with up to eight users per CPU. As an alternative, inter-Altos networking can be accomplished with Altos-Net/Unet software utilizing twisted pair cabling with high speed transmission speeds.

Three functional layers make up an Ethernet network: The network medium itself—consisting of shielded coaxial cable, transceivers, interfaces, and terminators; users—who initiate actions and request services; and servers—such as printers and other shared peripherals. Altos computers can be directly (locally) connected to Ethernet through Altos' Ethernet interface as well as indirectly (remotely) connected via telephone lines.

The Altos-Net/Unet software package uses the Internet Protocol (IP) and Transmission Control Protocol (TCP) to provide operating systems support for OEMs and software houses wishing to develop distributed applications.

At the applications level, the software provides file transfer capability, and electronic mail and terminal emulation protocols.

Altos' implementation of Ethernet costs \$2,500 per CPU, which includes Altos-Net/Unet networking software and the Ethernet controller. Cabling and transceivers are extra.

Altos Computer Systems, 2360 Bering Dr., San Jose, CA 95131. (408) 946-6700.

CIRCLE 349 ON READER SERVICE CARD

Toshiba Personal Computer

The Toshiba T100 personal computer has a 64K RAM. It also uses a 32K ROM for Basic and a 16K RAM for video. The T100 can accept four double sided, double density, 5 1/4" floppy disks each holding 280 kilobytes. It features a 90-key detached keyboard and a choice of five I/O video screen options, including a flat-panel liquid crystal display showing eight lines of 40 characters each.

Three other products announced by Toshiba America, Inc. are the P1350 LetterPerfect printer, OCR-V100 page reader, and DF-2100 document filing system.

TAI's P1350 LetterPerfect printer operates at 100 characters per second in word processing applications and at 160 cps for data processing jobs. The printer provides graphics production capability and handles interchangeable character fonts. It also provides friction or tractor paper feed of up to five-part copy.

The OCR-V100 page reader is a data entry unit which reads at 250 cps and recognizes a variety of typewriter fonts separately or in combination.

Toshiba's DF-2100 document filing system features charge-coupled device (CCD) technology for input, a laser disk system for filing, and a laser print system for hardcopy output. The unit stores up to 10,000 pages of text on laser disks measuring 30 centimeters in diameter.

Toshiba America, Inc., 2441 Michelle Dr., Tustin, CA 92680. (714) 730-5000.

SONY Business System

Sony Corporation of America announced a desktop microcomputer for business applications, the SMC-70, which is marketed through Sony's Communications Products Company.

There is a full range of peripheral devices and accessories available with the system, including an optional 16-bit adaptor unit that upgrades the SMC-70 from a Z80A system to an 8086 system. The basic unit offers 64K program/data memory, an additional 38K graphics memory and a separate 32K system memory. Also, 13 resident I/O interfaces are standard. The systems storage options begin with the 3.5" Sony micro floppy disk drives. Also available is a high density floppy disk, a 6 Mb hard disk system and a 256K cache memory device. The basic unit contains four different levels of

graphics and costs \$1,475.

Unix on CompuThink Hawk

CompuThink has designed the Hawk 32 as a 16/32-bit processor with a multi-user, multitasking system. The Hawk 32 is built around the MC68000 microprocessor which communicates externally with 16-bit capacity, but carries on internal communication at the 32-bit level. The Hawk 32 has a resident memory of 128 kilobytes which can be increased to one megabyte.

For simultaneous multi-user, multitasking applications, the Hawk 32 uses the Unix version 7 operating system developed by Bell Labs. The Hawk 32 Language library consists of 68000 Assembler, C, Pascal, Basic, Fortran 77 and ANSI 74 Cobol.

CompuThink, 965 West Maude Ave., Sunnyvale, CA 94086. (408) 245-4033.

Friends Amis (Panasonic) Hand-held Computer

Friends Amis, Inc. and the Matsushita Corporation have jointly created a hand-held computer based on the 6502 microprocessor with a 16K operating system in ROM. It is powered by rechargeable batteries.

The computer is expandable, when combined with the Friend Amis Data-shuttle, to 40K RAM and 96K ROM. The system can be connected to a variety of portable peripherals such as 40-and 80-column printers, four-color plotters, RS-232 ports, modems, and a video adaptor with color graphics.

There are RAM modules up to 16K each. Six such modules may be connected to the system. A portable Eprom burner lets HHC system users burn their own Eproms using SnapBasic, SnapForth, and other Friends Amis languages. Up to five 16K ROM capsules may be inserted simultaneously in the expanded system.

Friends Amis, Inc., 505 Beach St., San Francisco, CA 94133. (415) 928-2800.

CP/M Upgrade for DEC VT100

C. Itoh Electronics, Inc. introduced its own version of Digital Equipment Corporation's VT-18X upgrade kit, the CIT-188.

The CIT-188 allows both CIT-101 and DEC VT100 terminals to be upgraded to a 64K CP/M compatible, Z80 based personal computer.

The CIT-188 kit consists of a 64K Z80A based CPU board, a dual DS/DD 5 1/4" floppy disk package, and all necessary hardware, cables and installation instructions.

An optional add-on floppy disk package containing two additional 5 1/4" disk drives is available for \$1925. Also offered is an optional dual-processor CPU board, including Z80A and Intel 8088 microprocessors and 128K of RAM.

Distributor: Arco Corporation, 2515 McCabe Way, Irvine, CA 92714. (714) 557-5118.

(Jingle Bells, Jingle Bells, Jingle All The...)

We're really not rushing the season. We wouldn't even mention it if we didn't think you'd want to know.

The **Strictly Soft Ware** Holiday Catalogs (Apple & IBM) are going to be ready early this fall. More software than ever. Same great prices. And with a customer service and technical support program that's so good that...well, let's just say someone at the North Pole is on

our mailing list.

If you're already on the **Strictly Soft Ware** list, you'll automatically receive our Holiday Catalog. If you're not on the list, call us (toll-free) at 1-800-848-5263. Bulk mailing starts Oct. 1.

Don't be left out in the cold by not ordering the free **Strictly Soft Ware** Holiday Catalog. It may be the nicest present you get this year.

Holiday Gift Idea #1

*The **Strictly Soft Ware** Subscription Plan. Prepayment allows the account to be drawn upon for whatever you want, whenever you want. When we send the package, we'll provide a balance statement as well. Here's a gift that can last all year long.*

APPLE SPECIALS

Tax Man	\$19.95	Kids & the Apple ..	\$14.99

PRINTERS

IDS MicroPrism Printer

The MicroPrism Printer from Integral Data Systems offers dot matrix print quality approaching that of daisy-wheel printers.

The draft mode operates at 110 cps, while correspondence quality throughout is 75 cps. High-density graphics are available in 84 x 84 dot per inch format, and all modes print in a single pass. The MicroPrism makes use of a nine-wire staggered design printhead, capable of printing nearly fully-formed characters.

Integral Data Systems, Milford, NH 03055, (603) 673-9100.

CIRCLE 357 ON READER SERVICE CARD

Daisy Wheel/Dot Matrix Unit

Metaframe announced the Dotsy Printer Center which offers both 150 cps dot matrix and 20 cps daisy wheel printing. The dot matrix mode has a bi-directional 9 x 7 dot matrix with true descenders, and the daisy wheel mode has a bi-directional daisy wheel print element.

The print format for the dot matrix mode is 132 columns and for the daisy wheel mode is 132 columns at 10 pitch.

The dot matrix mode has a print speed of 150 cps and features 96 ASCII characters with upper and lower case. The daisy wheel mode has an interchangeable daisy wheel print element with over 60 type styles. Available interfaces include IBM, Apple II and III, Commodore PET, and TRS-80 I, II, and III. \$1450.

Metaframe Computer Corporation, Riverside St., Nashua, NH 06301. (603) 880-3005.

CIRCLE 358 ON READER SERVICE CARD

Versatile Daisy Printer

Daisywriter 2000 is an intelligent letter-quality daisy wheel printer, from Computers International. The printer features a 16K data buffer with an optional 48K buffer available. It also features a universal interface which makes it plug-compatible with all computer systems.

Daisywriter 2000 features: automatic proportional spacing, automatic centering, subscript, superscript, true automatic margin justification, 16 protocol selections, and automatic baud rate selections.

There are 12 different type fonts available in five different languages. The printer uses standard cartridge film ribbon such as used on IBM Selectric II and III. Controls allow for selection of 10, 12, or 15 characters per inch and 1, 1-1/2, or 2 line spacing. Baud rates are DIP-switch-selectable or automatic from 50 to 19,200.

Computers International, 3540 Wilshire Blvd., Los Angeles, CA 90010. (213) 386-3111.

CIRCLE 359 ON READER SERVICE CARD

GE Heavy duty Printer

General Electric introduced the 200 Document Handler Printer, designed for high-speed, heavy duty business use. The printer has a throughput of 200 cps, but still meets ISO NR-60 acoustic noise standards. Four software or switch selectable fonts are available, as well as switch selectable six or eight lines per inch modes.

General Electric, Data Communications Products, Waynesboro, VA 22980. (703) 949-1000.

CIRCLE 360 ON READER SERVICE CARD

Two New Anadex Units

Anadex, Inc., introduced the DP-9620A printer, a member of the "Silent Scribe" line, which features acoustic noise levels below 55 dBA.

The DP-9620A is a stand-alone printer capable of alphanumeric and graphics. Alphanumeric printing speeds range from 200 cps at 10 cpi for a 7 x 9 dot matrix to 100 cps for a 13 x 9 dot matrix. The character repertoire includes the 96-character ASCII set with lower case descenders. \$1025.

With multiple operational modes and speed ranges, the WP-6000 "Word Scribe" single pass printer provides letter quality, correspondence quality, draft quality, data processing and graphics printing for the office environment.

For word processing, letter quality printing of 10-pitch, 12-pitch, or proportional spacing can be produced at 150 to 180 cps. Speeds of 250 and 330 cps are obtained in a correspondence quality mode, with 10 and 12-pitch and proportional spacing. In both modes, character fonts include Serifa, Helvetica, and a complete scientific set. The price of the WP-6000 is \$1825.

Anadex, Inc., 9825 De Sota Ave., Chatsworth, CA 91311. (213) 998-8010.

CIRCLE 361 ON READER SERVICE CARD

Two from Apple

The Apple Computer Accessory Products Division announced two printers, the Apple dot-matrix printer and the Apple letter quality printer, as part of the company's plan to provide dealers and customers with fully supported systems. Both printers use the features of the Apple II and the Apple III.

The Apple dot-matrix printer has high-resolution graphics output (7 x 9 dot matrix) and a bi-directional speed of 120 characters per second. The Apple letter-quality printer is a 40 cps daisy wheel printer with graphics capability. It prints bi-directionally on individual sheets or continuous forms. Multiple fonts are selected by changing daisy wheels.

Apple Computer, Inc., 10260 Bandley Dr., Cupertino, CA 95014. (408) 996-1010.

CIRCLE 362 ON READER SERVICE CARD

AARDVARK — THE ADVENTURE PLACE

ADVENTURES FOR OSI, TRS-80, TRS-80 COLOR, SINCLAIR, PET, VIC-20

ADVENTURES — Adventures are a unique form of computer game. They let you spend 30 to 70 hours exploring and conquering a world you have never seen before. There is little or no luck in Adventuring. The rewards are for creative thinking, courage, and wise gambling — not fast reflexes.

In Adventuring, the computer speaks and listens to plain English. No prior knowledge of computers, special controls, or games is required so everyone enjoys them—even people who do not like computers.

Except for Quest, itself unique among Adventure games, Adventures are non-graphic. Adventures are more like a novel than a comic book or arcade game. It is like reading a particular exciting book where you are the main character.

All of the Adventures in this ad are in Basic. They are full featured, fully plotted adventures that will take a minimum of thirty hours (in several sittings) to play.

Adventuring requires 16k on Sinclair, TRS-80, and TRS-80 Color. They require 8k on OSI and 13k on VIC-20. Sinclair requires extended BASIC.

TREK ADVENTURE by Bob Retelle — This one takes place aboard a familiar starship and is a must for trekkies. The problem is a familiar one — The ship is in a "decaying orbit" (the Captain never could learn to park!) and the engines are out (You would think that in all those years, they would have learned to build some that didn't die once a week). Your options are to start the engine, save the ship, get off the ship, or die. Good Luck.

Authors note to players — I wrote this one with a concordance in hand. It is very accurate — and a lot of fun. It was nice to wander around the ship instead of watching it on T.V.

CIRCLE WORLD by Bob Anderson — The Alien culture has built a huge world in the shape of a ring circling their sun. They left behind some strange creatures and a lot of advanced technology. Unfortunately, the world is headed for destruction and it is your job to save it before it plunges into the sun!

Editors note to players — In keeping with the large scale of Circle World, the author wrote a very large adventure. It has a lot of rooms and a lot of objects in them. It is a very convoluted, very complex adventure. One of our largest. Not available on OSI.

HAUNTED HOUSE by Bob Anderson — This one is for the kids. The house has ghosts, goblins, vampires and treasures — and problems designed for the 8 to 13 year old. This is a real adventure and does require some thinking and problem solving — but only for kids.

Authors note to players — This one was fun to write. The vocabulary and characters were designed for younger players and lots of things happen when they give the computer commands. This one teaches logical thought, mapping skills, and creativity while keeping their interest.

DERELICT by Rodger Olsen and Bob Anderson — For Wealth and Glory, you have to ransack a thousand year old space ship. You'll have to learn to speak their language and operate the machinery they left behind. The hardest problem of all is to live through it.

Authors note to players — This adventure is the new winner in the "Toughest Adventure at Aardvark Sweepstakes". Our most difficult problem in writing the adventure was to keep it logical and realistic. There are no irrational traps and sudden senseless deaths in Derelict. This ship was designed to be perfectly safe for its' builders. It just happens to be deadly to alien invaders like you.

NUCLEAR SUB by Bob Retelle — You start at the bottom of the ocean in a wrecked Nuclear Sub. There is literally no way to go but up. Save the ship, raise her, or get out of her before she blows or start WWII.

Editors note to players — This was actually plotted by Rodger Olsen, Bob Retelle, and someone you don't know — Three of the nastiest minds in adventure writing. It is devious, wicked, and kills you often. The TRS-80 Color version has nice sound and special effects.

EARTHQUAKE by Bob Anderson and Rodger Olsen — A second kids adventure. You are trapped in a shopping center during an earthquake. There is a way out, but you need help. To save yourself, you have to be a hero and save others first.

Authors note to players — This one feels good. Not only is it designed for the younger set (see note on Haunted House), but it also plays nicely. Instead of killing, you have to save lives to win this one. The player must help others first if he/she is to survive — I like that.

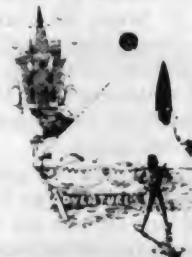

PYRAMID by Rodger Olsen — This is one of our toughest Adventures. Average time through the Pyramid is 50 to 70 hours. The old boys who built this Pyramid did not mean for it to be ransacked by people like you.

Authors note to players — This is a very entertaining and very tough adventure. I left clues everywhere but came up with some ingenious problems. This one has captivated people so much that I get calls daily from as far away as New Zealand and France from bleary eyed people who are stuck in the Pyramid and desperate for more clues.

QUEST by Bob Retelle and Rodger Olsen — THIS IS DIFFERENT FROM ALL THE OTHER GAMES OF ADVENTURE!!!! It is played on a computer generated map of Alesia. You lead a small band of adventurers on a mission to conquer the Citadel of Moorlock. You have to build an army and then arm and feed them by combat, bargaining, exploration of ruins and temples, and outright banditry. The game takes 2 to 5 hours to play and is different each time. The TRS-80 Color version has nice visual effects and sound. Not available on OSI. This is the most popular game we have ever published.

MARS by Rodger Olsen — Your ship crashed on the Red Planet and you have to get home. You will have to explore a Martian city, repair your ship and deal with possibly hostile aliens to get home again.

Authors note to players — This is highly recommended as a first adventure. It is in no way simple—playing time normally runs from 30 to 50 hours — but it is constructed in a more "open" manner to let you try out adventuring and get used to the game before you hit the really tough problems.

ADVENTURE WRITING/DEATHSHIP by Rodger Olsen — This is a data sheet showing how we do it. It is about 14 pages of detailed instructions how to write your own adventures. It contains the entire text of Deathship. Data sheet — \$3.95. NOTE: Owners of OSI, TRS-80, TRS-80 Color, and Vic 20 computers can also get Deathship on tape for an additional \$5.00.

PRICE AND AVAILABILITY:

All adventures are \$14.95 on tape except Earthquake and Haunted House which are \$9.95. Disk versions are available on OSI and TRS-80 Color for \$2.00 additional.

Please specify system on all orders

ALSO FROM AARDVARK — This is only a partial list of what we carry. We have a lot of other games (particularly for the TRS-80 Color and OSI), business programs, blank tapes and disks and hardware. Send \$1.00 for our complete catalog.

Epson Grafrax-Plus

Grafrax-Plus graphics capability for the Epson MX Series of printers was introduced by Epson America. Grafrax-Plus is standard in the MX Series and is also available as retrofittable PROMs. It includes 66 different type fonts.

Other features of Grafrax-Plus include programmable form length, horizontal tab and right margin, software printer reset, and true backspace. It also produces graphics with up to 120 dpi horizontally and 216 dpi vertically.

Epson America, Inc., 3415 Kashiwa St., Torrance, CA 90505. (213) 539-9140.

CIRCLE 365 ON READER SERVICE CARD

Dataproducts Daisy

The DP-55 is a letter-quality daisywheel printer from Dataproducts Corporation that is rated at 55 cps and offers quiet operation, superior print quality, digital status display, and printing with metal or plastic print wheels.

The DP-55 provides a horizontal resolution of 120 positions per inch with 10, 12 or 15 characters per inch, as well as proportional spacing. Vertical resolution is 48 positions per inch with six or eight lines per inch. It has 16 different printer conditions.

In addition to standard RS-232C links, interfaces with a wide range of different printer personality characteristics are

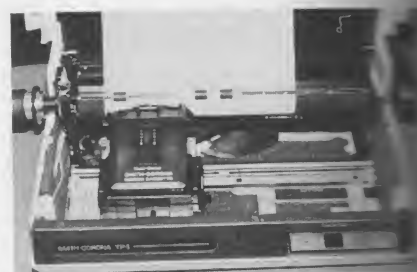

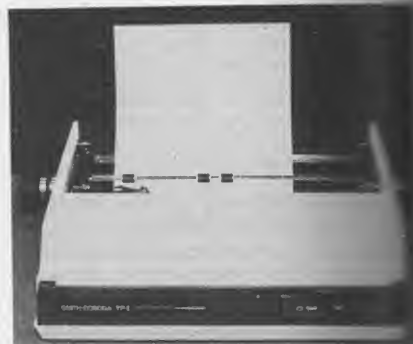

available, including such options as Qume, Diablo, and Centronics parallel interface. Expandable memory up to 12K bytes, and a 32K ROM and from 1K to 32K RAM offers users the ability to customize operating parameters. The DP-55 costs \$1400.

Dataproducts Corporation, 3300 Canoga Ave., Woodland Hills, CA 91367. (213) 887-8451.

CIRCLE 366 ON READER SERVICE CARD

Economical SCM Daisy

SCM announced the TP-1 daisywheel printer, bringing the cost of true letter-quality to a price affordable to individuals and small businesses. The TP-1 prints unidirectionally at 12 cps. For this sacrifice in speed, it offers high quality

Interchangeable daisy wheels are available in 10 and 12 pitch versions.

DISPLAYS

8 1/2 x 11 Page Display

Micro Display Systems announced The Genius full page display terminal for mini and microcomputers. The Genius displays 57 lines (73 optional) of 80 characters, or a full 8 1/2" x 11" page. Each character is composed of dots in a 7 x 12 format within a 9 x 14 field, giving outstanding resolution.

A raster video generator is located in an enclosure with the CRT and a separate power supply. An interface card plugs into an Apple II slot. The video generator has its own 8K memory so no load is presented to the Apple CPU for refresh.

WordStar software is available for The Genius. In addition, it can emulate other 80-column cards.

Also announced were three compatible interfaces for The Genius full page display CRT: the RS-232, S-100 and Apple III versions.

The Genius is compatible with Soft-Card WordStar, and other CP/M based software programs. The 36 lb. display has an 87 MHz bandwidth and 8K high-speed buffer memory. An Apple II interface card is standard with The Genius, which costs \$1795. RS-232, S-100 or Apple III interfaces may be selected at no additional charge.

Micro Display Systems, Inc., 1310 Vermillion St., P.O. Box 455, Hastings, MN 55033. (612) 437-2233.

Neat NEC Monitor

A 12" green phosphor monitor was announced by NEC Home Electronics. The JB-120M has 600-line resolution and display stability during power supply fluctuations. Input is via a standard RCA jack.

NEC Home Electronics (U.S.A.) Inc., 1401 Estes Ave., Elk Grove Village, IL 60007. (312) 228-5900.

CIRCLE 371 ON READER SERVICE CARD

Amdek RGB Monitors

Designed with RGB video input and using a commercial grade CRT, the portable 13" Color III professional monitor from Amdek Corporation provides high-plus resolution graphics display for Apple III and Apple II computers. The Amdek Color III Monitor features 26 x 300 line resolution and 80 x 24 character display capability.

To allow the Apple II and III to be used with an RGB monitor, Amdek has an interface called Digital Video Multiplexor. The Color III retails at \$569.

The Digital Video Multiplexor (DVM) is an interface for Apple II personal computers that obtains high resolution color graphics and an 80 x 24 character display. The DVM is basically a four-channel multiplexor—three color channels (under software control) for low and high resolution images and a fourth channel which allows use of an 80-character video board. \$199.

A low cost Digital Video Multiplexor for interfacing the Apple II computer to an RGB color monitor for high resolution graphics and 80 x 24 text display was also introduced by Amdek. The Combo-DVM is software color-channel programmable, permitting computer control of the RGB

quality mode at 100 cps. Modes are software selectable. The print head is a 24 pin, overlapping design, capable of producing high quality dot matrix text, as well as graphics. The P1350 accepts friction, pin, or tractor feed paper, as well as offering an optional automatic sheet feeder. Paper may be 5" to 15" wide.

Toshiba America, Inc., Information Systems Division, 2441 Michelle Dr., Tustin, CA 92680. (714) 730-5000.

CIRCLE 373 ON READER SERVICE CARD

Lobo CP/M, IBM Drives

Lobo Drives International has a full line of disk drives which support CP/M on the NEC PC-8000 computer system. Lobo software enhancements support the standard NEC PC-8031A Mini-Disk Unit; Lobo 8", single or double sided, double density floppy systems; and Lobo 5 1/4" or 8" hard disk systems.

All of these drive types can be on line at once; the simple hardware set up and software start up procedures allow the user to designate the boot drive. When a Lobo dual drive 8" floppy system is in

use, the Lobo floppy is able to write in either single or double density format, thus allowing compatibility with standard CP/M systems and package CP/M software.

Lobo also announced high capacity add-on 8" floppy disk systems for the IBM Personal Computer. The Lobo add-on system can be configured with the user's choice of two or four 8" drives, each of which may be single or double sided. With 630 kilobytes per side (double density format), a system of four double sided drives makes available over 5 megabytes of on-line storage. Connection to the computer is made via a Lobo interface board. A minimum system with two single sided drives is \$1625. A maximum of four double-sided drives is \$3774.

Lobo also offers a 60K compatible version of the CP/M support software for the Apple II. These BIOS modifications are upward compatible with existing Lobo CP/M support and are usable with either the 56K or 60K versions of Microsoft CP/M. Both versions require a Microsoft SoftCard and 16K RAM card. Dual 8" floppy systems are available in single or double sided models and come with the LCA-22 controller interface which can be plugged into either slot 5 or 7. The Lobo software allows these floppy drives to read and write in double density format. Model 950A is \$3663, Model 1850A is \$4459, Model 5202CA is \$2025, and Model 8202CA is \$1625.

The Pack allows eight personal computers to share a single Winchester disk. The Pack is a compact hardware multiplexor which attaches to any Lobo Winchester disk unit, and contains interfaces for up to eight computers (any combination of Radio Shack TRS-80 Model I or III, and/or Lobo's new Max-80).

Lobo Drives International, 358 S. Fairview Ave., Goleta, CA 93117. (805) 683-1576.

Axlon Atari Add-ons

The Axlon RAMdisk 320K Memory System, developed by Axlon Inc., is for the Apple II. Offering 320K bytes of RAM memory, the system functions like two 35-track floppy disk drives. It is compatible with Apple DOS 3.3 and Apple Pascal 1.1, and the CP/M and Flex operating systems.

The Axlon RAMdisk 320K Memory System includes software for diagnostics, fast load and copy routines, and business applications. The system draws no power from the Apple, has memory refresh when the Apple is off, and has a built-in rechargeable battery (good for 3 hours).

Axlon also announced the Atari 800 users' modification called the RAMcram 32K Memory Module. The RAMcram can be used with Axlon's RAMdisk 128K

Memory System. Together, RAMcram and RAMdisk provide a total of 160K RAM memory while leaving the third RAM slot open for future expansion.

When the RAMdisk is used as an additional disk device in conjunction with the Atari 810 disk drive, it is compatible with software using Atari DOS 2.0S. The RAMdisk 128K Memory System includes the 128K RAMdisk module, operating manual, Memory Management Software and utility software.

Axlon Inc., 170 N. Wolfe Rd., Sunnyvale, CA 94086. (408) 730-0216.

CIRCLE 375 ON READER SERVICE CARD

SONY 3.5" Microfloppy

Sony Corporation was showing their 3.5 micro floppy disk system. Sony's micro floppy disk is 3.5" in diameter and can record 437.5K bytes of information (unformatted) on one side, a density much higher than existing systems. The disks are housed in rigid plastic cases which provide good protection from dust and dirt.

Sony Corporation of America, Corporate Communications Department, 9 West 57th St., New York, NY 10019. (212) 371-5800.

Introducing
the
SERIES 900

MARKET MAVERICK

A new stock market program from FSI for the serious investor

Used with the Apple II*, the Series 900 "Market Maverick" provides immediate investment counsel and is not just another device that raises more questions than it answers. Utilizing shorter forecast time horizons, Series 900 has a long history of excellent performance even under extreme market conditions. With fewer inputs, it is user friendly—yet it answers questions asked from many angles and points of view.

Series 900 "Market Maverick" is not a game. It is not theoretical. It is for the serious investor or stock broker. Send for yours today. **Requires 48K Apple II/II Plus, DOS 3.3 and AppleSoft in ROM or 16K RAM expansion.**

Save \$30...Limited Time Offer. If you order now, we will ship your Series 900 "Market Maverick" for just \$145.00—and that's \$30.00 off the regular price! MasterCard/Visa welcome, as are dealer inquiries.

- * Over 10 years of excellent performance
- * Stock data provided for immediate use on over 900 stocks
- * Logic is based on precisely-read variables
- * Fantastic results in up or down markets

SAVE \$30

Printer Buffer for Apple

Practical Peripherals introduced Microbuffer, a device designed to allow microcomputers to continue processing while printing takes place. Microbuffer models have been designed to fit virtually all microcomputers and printers.

Text is spooled to the memory of Microbuffer, which in some models can be expanded from a minimum of 16K to 256K. The printer is then driven by Microbuffer, freeing the computer for other use.

Microbuffer is available for inboard installation in the Apple II, in parallel or serial versions. It is also available in models designed specifically for Epson printers, as well as "in-line" design to fit other micro/printer or micro/modem combinations.

Practical Peripherals, Inc., 31245 La Baya Dr., Westlake Village, CA 91362. (213) 991-8200.

Softlights

By Fred Huntington

It's an exciting time around the Huntington household this month. We're very proud to announce the birth of our seven-pound five-ounce baby boy, Dale, born on June 6, 1982 in Visalia, California. Baby and Mama are doing just great and Melody (our three-year-old) loves him and calls him "My baby."

The other big news is that I have resigned my position as school principal so that I may devote full time to Huntington Computing.

We're instituting lots of changes to improve efficiency and speed. Our goal is to get everything out of the door within twenty-four hours with no backorders.

To celebrate the excitement, we're offering the following specials: (Always an excuse to run a sale.)

#9010 Wurst of Huntington

#9140 Great Grandma Huntington

T-Shirt - **\$5.00**

GREAT GRANDMA SAYS

Great Grandma Huntington once told me about a computer the Russians invented that was so smart it defected to the West!

Great Grandma also said, "Please buy little Freddy's Wurst of Huntington, because he personally gets two dollars for every one he sells. And, it's good. Just read the review in October 1981 issue of Softalk."

Watch next month's Softlights for the winners of the Great Grandma Huntington contest. There were some fantastic entries.

128K RAM. \$100.

Apple II *Senior Analyst* and Apple II *Business Graphics* are business software for financial modeling and graphics. Both programs require a 48K Apple II or Apple II Plus with a language or memory card. Apple III *Business Graphics* requires a 128K Apple III. The suggested retail prices are \$225 for *Senior Analyst*, and \$175 for Apple II or Apple III *Business Graphics*.

Apple III *Cobol*, is a Cobol language capable of executing mainframe applications. Apple III *Cobol* features Animator, a screen-oriented, source-level debugger and Forms-2, a Cobol source code generator which creates data entry screens and generates Cobol source for use in a program. Apple III *Cobol* requires a 128K Apple III system, a video display device, and at least one external floppy or hard disk drive. Full use of the Animator requires 256K. \$500.

Record Processing Services, designed for Apple III Pascal software developers, provides file management services for programs handling large quantities of data. The multi-key file access method allows files to be readily interchanged among programs built on *RPS*. *RPS* supports the Apple ProFile hard disk and any other SOS block device, allows a maximum file size of 16 megabytes, permits up to eight keys per file and multi-field keys, and permits multiple simultaneous file scans, optional concurrency control and file locking. It also features six access modes, eleven data types, and duplicate and/or null key values. \$150.

SuperPilot is a versatile extension of Apple Pilot. Also announced were two support products in the Apple Pilot family, *Co-Pilot* and *SuperPilot Log*. *Co-Pilot* is a self-contained, self-paced interactive tutorial on two diskettes which teaches how to program in Apple Pilot. *SuperPilot Log* works with *SuperPilot* as an administrative record keeping program. *SuperPilot* requires an Apple II or Apple II Plus with 64K RAM, \$200. *Co-Pilot* is \$35, and *SuperPilot Log* is \$50.

Apple Logo is an implementation of the Logo computer language for the Apple II. It requires an Apple II or Apple II Plus with 64K RAM. The software package, priced at \$175, includes a program diskette, a backup diskette, a graphics manual, and a language reference manual.

Eight independently developed software programs for business, education, and the home were also offered by Apple Computer. *Comm-Pac* is a data communications program that enables an Apple II to communicate with other computers, timesharing systems, networks, news-wires, and other subscription services. \$85.

Parallax is a collection of graphics utilities which lets the user develop and manipulate high-resolution shapes for Applesoft Basic programs. \$85.

Designer's Toolkit is a program for the Apple II that computerizes the drafting table to let the user generate graphics for mapping, architecture, and drafting. \$225.

Magic Spells is a learning game that transforms the memorization of spelling lists into an adventure complete with castles, treasures, demons, and a sage wizard. \$45.

Math Strategy and *Spelling Strategy* are two programs that teach youngsters how to use the mind's eye to sharpen math and spelling skills. It uses Neuro-Linguistic Programming. \$45 each.

Moptown is a collection of logic games for children aged four and up. \$50.

Speed Reader is a reading development course designed to increase reading speed while increasing comprehension. \$70.

Apple Computer, Inc., 10260 Bandley Dr., Cupertino, CA 95014. (408) 996-1010.

CIRCLE 384 ON READER SERVICE CARD

Atari Software

Four new Atari Home Computer programs, a telecommunications kit and several computer programs were announced by Atari, Inc. Atari also announced a reduction in the suggested retail price of the Atari 400 to \$349.

Atari Speed Reading, which combines computer programs and the Speedway reading course includes five cassettes and a manual, and is recommended for users 15 years old and up. \$74.95.

Atari Music Tutor I teaches music fundamentals such as note reading, the C Major scale, and key signatures. Both programs are available in both cassette and diskette versions.

Juggles' House and *Juggles' Rainbow* teach pre-reading skills to children aged three to six at home or in a school environment. *Juggles' House* teaches the concepts of upper, lower, inside and outside, while *Juggles' Rainbow* teaches above, below, left and right. It's available in both cassette and diskette versions.

The *Communicator II* is a kit that allows the user to explore the wide range of information, education and entertainment available through computer services, and to communicate with other computers. The Atari 835 Direct Connect Modem (DCM), the TeleLink II cartridge, and a manual are included. \$279.95.

The Atari 835 DCM connects the computer directly to a phone line without the need for an acoustic coupler, although it must be used with TeleLink II. The DCM is only available with the *Communicator II* kit. The TeleLink II cartridge is priced at \$79.95.

Other programs include *Asteroids*, *Computer Chess*, *Missile Command*, *Space Invaders* and *Super Breakout* for \$34.95 each; *Star Raiders* for \$44.95; and *Music Composer* for \$39.95.

Atari Inc., 1265 Borregas Ave., P.O. Box 427, Sunnyvale, CA 94086. (408) 745-5227.

CIRCLE 385 ON READER SERVICE CARD

IXO Software & Peripherals

IXO, Inc. announced six applications for its telecomputing system—field sales, electronic mail and banking, public data base access, airline reservations and remote personal computing. The telecomputer is a hand-held system with the capability to remotely access and communicate with host computers via plain English prompts and responses. It consists of a full typewriter-style keyboard, LCD display, telephone modem and sophisticated security system, and plugs into any modular telephone jack.

Four optional peripherals are available for the telecomputing system. These are a 20-column, 30 cps thermal dot matrix printer; a 32-character x 16-line video interface that works with video monitors and television receivers; a serial/parallel printer interface to enable the telecomputing system to be used with most 80-column plus printers; and, for those instances where no modular phone jack is available, an acoustic interface. \$300.

IXO, Inc. 6041 Bristol Parkway, Culver City, CA 90230. (213) 417-8080.

CIRCLE 386 ON READER SERVICE CARD

VIC-20 Software

Source Marketing, Inc. has announced eight software programs designed to run on the Commodore VIC-20 home computer. Programs are on cassette tape. Offerings include five games, a home and small business management program, one educational program and an entertainment program. Suggested retail price of cassettes is \$19.95.

Source Marketing, 50 West Brokaw Rd., Suite 64, San Jose, CA 95110.

CIRCLE 387 ON READER SERVICE CARD

SEARCHING FOR RECORDS CAN BE A REAL HASSLE.

It always seems to happen at the wrong time. A file cabinet or two filled with records that are not *quite* in alphabetical order. In there somewhere is the right record, but there's just no way to find it without leafing through the whole mess. Sound familiar?

With DB MASTER finding the right record takes about *three seconds*. You just call up the name, say "Mark Piper," or invoice number "38965," and there it is in front of you. No worries. No misfiling. No anxiety. Think what it means for a business where you constantly need to check product inventories or customer billing status.

But what if you don't know the whole name or the exact number you're after? No problem. DB MASTER's "Search" method makes it simple to find what you're after. For example, you can call up all the "Pipers" and stop when you recognize the right one. And there's more. You don't even have to know the name at all. If all you really know is that it begins with a "P", for instance, you can use DB MASTER's "Wild Card" feature. It'll give you every name in your file that begins with "P". The same goes for a range of numbers. Punch in the range of digits you know, and you'll get a series to choose from. Try *that* with your filing-cabinet system.

We designed DB MASTER to make your life easier. Sure, there are other data base systems available for

WITH DB MASTERTM IT'S EASY.

your Apple II. But, if you're not using DB MASTER you're simply

not getting all you could from your data base manager.

Want more capability? DB MASTER provides it with the

expanded-capacity Special Edition for Hard Disk to complement the popular floppy diskette version. And there are three powerful accessory programs. UTILITY PAK #1, for example, allows you to access other standard Apple files (including VisiCalc), and even change the way you've structured your files. UTILITY PAK #2 allows you to edit or change up to five "fields" in a single pass through your files. And STAT PAK performs statistical analyses on data in your DB MASTER files. Of course, there's considerably more capability in each of our accessory paks than we have room to talk about here. Ask your dealer for the full details.

Stoneware backs up DB MASTER with a support staff second to none. Just give us a call. We can help solve your problems. After all, that's what Stoneware and DB MASTER are all about.

Apple Plotting Packages

T & W Systems has expanded their product line to include the *Cadapple*, a version of the *T-Square Cad* software which runs on a standard Apple configuration. Hardware required includes a 48K Apple II with Apple Pascal 1.1, two standard 5 1/4" drives, the CCS asynchronous serial interface model 7710, monitor, joystick, or HiPad digitizer and the Houston Instruments DMP-7 plotter.

The program allows the designer to create, erase, change, store and retrieve drawings consisting of graphics and text. The *Cadapple* provides generation of arcs, circles, rectangles, ellipses, regular polygons, arbitrary curves and user defined shapes.

The *Cadapple* is available as a turnkey system, or the software and/or plotter can be purchased separately. The turnkey system including software and hardware with joystick is \$9985. The turnkey system including software and hardware with HiPad is \$10,775. The *Cadapple* software is \$2495.

T & W Systems, Inc., 18437 Mt. Langley #B, Fountain Valley, CA 92708. (714) 963-3913.

CIRCLE 389 ON READER SERVICE CARD

Japan, Inc. goes Microsoft

Four Japanese manufacturers announced support of Microsoft's MS-DOS operating system, a 16-bit operating system developed by Microsoft for the IBM Personal Computer. Hitachi offers the MB-16001, a general purpose personal computer running Microsoft Graphics Basic. NEC offers the NEC 5200 which is designed as a high-end business machine. Panasonic supports MS-DOS on their JB-3000 microcomputer, a low-end machine with a color graphics capability. Panasonic also supports both Multiplan and Microsoft's Graphics Basic. Wang will also support MS-DOS.

Users of MS-DOS systems can run the applications programs available for the IBM Personal Computer as well as all

Microsoft languages—MS-Basic interpreter and MS-Fortran, MS-Basic, MS-Pascal and MS-Cobol compilers—on their 16-bit microcomputers.

Microsoft Corporation, 10700 Northup Way, Bellevue, WA 98004. (206) 828-8080.

Accounting Packages

Three major manufacturers of personal microcomputer systems—Toshiba, Sony, and Xerox—will offer Structured Systems Group (SSG) accounting software (Version 2.0). The complete line of SSG accounting software (Version 2.0)—General Ledger, Accounts Receivable, Accounts Payable, Order Entry, Inventory, and Payroll—run on the Toshiba T-200250, the Xerox 820, and the Sony SMC 70 personal computer.

Structured Systems Group, 5204 Claremont, Oakland, CA 94618. (415) 547-1567.

CIRCLE 391 ON READER SERVICE CARD

Robot Programmer

Savvy is an information handling system for microcomputers. It has a natural programming language, its own operating system automatic database management, and applications programs.

Savvy learns your own language and translates it into a simple language. The Robot Programmer has been trained to write programs needed to input, output, add, change, and delete database information. *Savvy* comes as a combination of hardware and software—a co-processor with firmware, and additional software on a disk. It will boot and run on all Apple DOS versions and Z80 versions of CP/M.

Excalibur of America, 1176 Franklin Rd., S.E., Marietta, GA 30067. (404) 953-6870.

CIRCLE 392 ON READER SERVICE CARD

NEC Software

NEC Home Electronics USA introduced an orientation to the basics of computer operating and programming. Called *Creative Programming*, the beginning software program and guidebook is designed to help early users learn microcomputer operation in four short lessons. The lessons cover computer language introductions and the significance of the basic functions, how to write a program, and how to load a program. The course is for use on the PC-8000 Series Microcomputer System. The first *Creative Programming* manual retails for \$12.95. The remaining five volumes retail for \$9.95 each.

The *Basic Language Learning Guide* program concentrates on the features, commands and functions of Microsoft N-Basic. Included are discussions of The Concept of a Variable, Math and the Computer, Format Notation, and Elementary Statements. In addition, there are six appendices devoted to special keys and control characters, reserved words, ASCII Character set, error messages, disk files and N-Basic statements. It is best suited for use with the NEC PC-8000. \$19.95.

NEC also has a color word processing system with a self-teaching program and 12,000 word dictionary for the PC-8000.

NEC also has a *Job Costing* system which allows users to keep easier and more accurate track of internal costs by category. The Job Cost System is marketed with the PC-8000, and can interface with the NEC General Accounting System and Payroll System programs. It features a Skeleton General Ledger, Work Codes/Cost Centers, Estimates, Labor/Nonlabor Journals, Income and Expense Statement, and Job Status Report.

The *General Accounting System* for the PC-8000 can be operated by people without prior computer experience. Each Accounts Receivable diskette allows for 500 or more entries. Additional features include an 80-column data entry screen, multiple bank account capability, and capacity for eight separate payroll accounts with payroll summaries by month, quarter and year-to-date. The General Accounting System retails for \$395.

Report Manager is a CP/M based program that creates and updates a variety of reports for financial, accounting, engineering and scientific applications. It features editing commands, multiple report pages, the ability to copy portions of rows, columns, or pages; and the ability to reform calculations on calendar and time entries.

Money Decisions provides a collection of business and financial problem-solving tools. Programs on the disk include 34 of the most frequently used business and financial problem-solvers. Among the financial tools included are Future Value of an Investment, Net Present Value, Internal Rate of Return, Term of a Loan, Regular Payment on a Loan, Mortgage Amortization Table, Lease/Purchase Analysis, Depreciation Rate, Tax Depreciation Schedule, Optimal Production Quantity and Breakeven Analysis.

The *Term II* program connects the PC-8000 to the world of telecommunications. Users may talk via their computer screens, transmit files to or receive files from a general purpose time sharing host system such as CompuServe or The Source.

File-Fax is a database and information management system for the PC-8000. It

assures user flexibility and eliminates any requirement for following a certain pattern or structure.

NEC Home Electronics (U.S.A.) Inc., 1401 Estes Ave., Elk Grove Village, IL 60007. (312) 228-5900.

CIRCLE 393 ON READER SERVICE CARD

Fortune Business Software

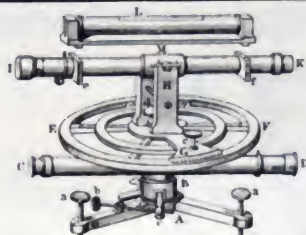

Fortune Systems Corporation introduced for its desktop computer a package of business accounting software that has been transported to the Fortune 32:16, the company's Motorola MC68000-based microcomputer. The menu-driven accounting system consists of seven modules: order processing, accounts receivable, purchase orders, accounts payable, payroll, fixed assets and general ledger. The business system also features file protection, a password security system and user-selected formatting and report generation capabilities. The Fortune 32:16 supports Cobol, Fortran, Pascal and C as well as Basic. The system is based on the Motorola MC68000 32/16-bit chip and uses the Unix operating system. The 32:16 also has Ethernet communications capability. Price is \$4,995.

Fortune Systems has signed a license agreement with the IMJ Software Center that provides the Fingraph graphic management information system. This package is used to provide graphic displays of sales management, accounts receivable, income statements and balance sheets. More than 100 standard information charts can be produced directly from the computerized data sheets.

Fortune Systems Corporation has entered into a licensing agreement with Microsoft Corporation to enhance the Unix operating system. The agreement calls for a technical exchange and makes Fortune Systems the master distributor for the finished product. Microsoft will initially supply Microsoft-developed system enhancements that Fortune Systems can add to its version of Unix. The company will also provide ongoing support and maintenance to Fortune Systems for the operating system.

Fortune Systems Corporation, San Carlos, CA (213) 557-1331.

The Handicapple

A Low Cost Braille Printer

Barry McConnell

One of the most valuable features of the home computer is its versatility. Home computers have found a place in the laboratory, the classroom, and in the office. Most recently, they have found a place with the handicapped.

The low cost and easy adaptability of the home computer makes it an ideal tool for serving the needs of the handicapped, both on the job and in the home.

At Florida State University, handicapped students are competing with non-handicapped students on an equal basis and are finding new career opportunities through the use of home computers. This article outlines one of several ways in which microcomputers have been adapted to the needs of the handicapped.

One of the first things anyone working with a computer needs is a printed copy of his work. A multitude of printers can be found in the marketplace, but what of the blind individual? How does he read what comes out of the computer? There are very few braille terminals on the market and they tend to be prohibitively expensive for the average person. Additionally, braille terminals, since their design is similar to that of a line printer, are not well suited to word processing or other forms of formatted output. A low cost alternative is available.

Often promoted as the "poor man's printer," the Dynatyper by Rochester

Data, Inc. provides the key to low cost braille. The Dynatyper is a solenoid driven array of plastic plungers which sits above the keyboard of a standard typewriter. When coupled with an IBM Braillewriter and a home computer, it gives blind people access to hard-copy braille at an affordable price.

Our emphasis at FSU has been on the use of off-the-shelf components to keep costs down and application simple. This configuration fits well in both the home and in the workplace at a minimal price.

Our system consists of an Apple II, a Dynatyper, and a Braillewriter (see Figure 1). Set-up of the system is reasonably

Barry McConnell, P.O. Box 2676, Tallahassee, FL 32304.

LOWER PRICES, COME HELL OR HIGH WATER.

“ I'll match any advertised price on any item you want to buy from us. And if—Heaven forbid!—you find a lower price on what you bought within 30 days, just show me the ad and I'll refund the difference. ”

The Handicapple, continued...

simple and well described in the Dynatyper manual, which is fairly straightforward though not always easy reading. The only alterations required to the standard configuration consist of a modification of the braille typewriter and a change in the driving software for the Dynatyper.

The Braillewriter is an IBM office typewriter which is converted to type in braille, and has a keyboard consisting of the standard letters, numbers, and punctuation found on an ordinary typewriter.

The shifted keys provide the Grade II contractions used as a form of Braille shorthand. The paper is embossed from the front by raised dots on the typeface and rolls backwards so that the finished paper comes out the rear of the machine.

The modification necessary to operate as a braille printer is a result of the Braillewriter being designed for the blind. The tension springs on the keys are deliberately stiff so as to provide a positive keystroke for a blind individual.

These springs must be stretched as the Dynatyper was designed to operate principally with electric typewriters. Initially, the keys were so stiff that the Dynatyper plungers literally bounced off the keys. The service representative from IBM was very helpful in diagnosing the problem and remedying it.

The modification to the Dynatyper software consisted of designing an alternate character set for braille. Anyone familiar with braille will tell you that it was definitely not designed by a mathematician, as the same dot pattern may mean two entirely different things, depending on the context. For example, the period and dollar sign have the same dot pattern, but a dollar sign is never found at the end of a sentence.

Because we were committed to low cost and easy implementation, we altered the braille character set rather than developing a context analyzing driving routine, which would have required many man-hours in development and would have increased drastically the time necessary to print even the simplest document.

One of the first things anyone working with a computer needs is a printed copy of his work.

The availability of the Grade II contractions on the Braillewriter provided a source of extra dot patterns for redefining characters. By converting lower case letters to upper case and assigning a Grade II symbol to each of the special characters, e.g. comma, period, etc., a one-to-one correspondence between the computer keyboard and a braille character was obtained. Special care was taken in redefining characters to make the dot pattern resemble the actual shape of the character whenever possible (see Table 1), in order to facilitate learning of the new character set.

Implementation of the new character set was greatly enhanced by the manner in which the driving routine is loaded; it is loaded from DATA statements by a Basic program. The manual provided for the Dynatyper gives excellent instructions

on modifying the existing character set by changing the DATA statements.

Listing 1 shows the line numbers and the data necessary to implement the new character set in Applesoft. Integer applications would modify the array D located in lines 4350 through 4460, using assignment statements rather than DATA statements. The TRS-80 version requires modification of lines 1190 through 1300, starting with the second DATA value (209) on line 1190.

In 18 months of operation, this system has proven to be remarkably durable. It has survived two changes of offices, more than fifty conferences and demonstrations, and a tremendous number of tinkering sessions, with the most serious problem being an occasional key jam. The system is operating at the maximum recommended speed for the Dynatyper with a manual typewriter; slowing the speed would eliminate even those rare key jams.

This system has been coupled with a Control Data Corporation mainframe as a remote terminal providing braille copy to computer science students, and with two different word processing programs for the Apple, *Professional Easywriter* and *Applewriter*, though the carriage width and the size of a braille character allow only 40 characters on a line. It has also proven to be an excellent tool for programming the Apple itself, providing program listings in braille for blind programmers.

Many other applications are possible, and if the spark and enthusiasm of the blind individuals who have worked with this system thus far is any indication, they will soon be demanded. As one blind student said, "Don't give me a handout, give me the tools and I'll build you a world!" □

Table 1.

Who Really Invented the Video Game?

The Space Age had just been birthed. Sputnik was a new and somewhat ominous presence in the evening sky—my father tells me he carried me to the roof of our apartment building to see it. I don't remember. The year was 1958, and I was two years old.

Dave Ahl, my boss, was a high school student. He had won a scholarship, one benefit of which was a tour of Brookhaven National Laboratory in Upton, NY. Something he saw on an oscilloscope there remained fixed in his mind for many years, and caused, among other things, a recent pilgrimage of my own.

Nearly 25 years after the fact, I found myself on the Long Island Expressway. I was trying to pass an eighteen-wheeler spewing gravel off its trailer, while I looked for the Brookhaven exit. It occurred to me that the Lab was hardly a stone's throw from Shoreham Nuclear Power Station, that controversial patch of multibillion-dollar poured concrete. I wondered if the proximity was mere coincidence.

Brookhaven is a government installation, and I get nervous at checkpoints. The guard at the gate had a familiar kind of hypertensive bearing. I wished then I had shaved that morning. I proffered my press card with clammy claw. He told me to pull my car off to the side; I knew the jig was up. I was a spy, an agent, a saboteur, and it was all over.

He handed me a piece of paper and said those chilling words: "Have a nice day." Upon inspection, the paper seemed to be a visitor's map. My adrenalin level began to subside.

It's really very simple to get to the

John Anderson

Department of Nuclear Energy. You make a right near the linear accelerator, and pull into the lot next to the alternating gradient synchrotron. If you see the tandem Van de Graff, you've gone too far.

From there, only one flight of stairs separates you from one of the great, unsung heroes of our time, Willy Higinbotham.

There was Bell, there was Edison, there was Fermi. And then there was Higinbotham.

Willy was responsible for the display

***There was Bell, there
was Edison, there
was Fermi. And then
there was
Higinbotham.***

Dave saw on that fateful day in 1958. Willy, you see, invented the video game.

We've received several manuscripts which attempt to set the record straight on the history of the video game. If you claim and can document a video game predating 1958, let us know.

Otherwise, give Willy Higinbotham his profound and historic due. Much to the chagrin of large corporations involved in current litigation, he did it first, and he has proved it.

Though he stands about five feet four inches tall, Mr. Higinbotham commands quite a stature. He very nearly chain-smokes unfiltered cigarettes, which he wolfs down with great voracity for a man of 72 years. His eyeglasses magnify to the point where his corneas seem as large as quarters. He laughs easily and likes to play the accordion, though he admits it's been a while since he's played at a party.

And, as a physicist in the Manhattan Project, he witnessed the detonation of the first atomic bomb.

Before we sat down to speak in earnest, Willy called an old friend, Dave Potter, and asked him to join us. Dave had worked with Willy on the original game designs. We adjourned to a conference room. As Willy got started, other scientists would wander into the room, find a perch, and listen along. "Isn't he something?" one of the scientists whispered as an aside. He sure is.

Back in the 1950's, when tours of the Laboratory were first instituted, they were rather static affairs, usually consisting of a group of photographs to depict some facet of research at the facility. Willy, who discovered his penchant for physics at Cornell and electronics at MIT, explained that he wanted to make his display more dynamic. Give it a little punch. Wouldn't it fill the bill, he thought, if we got some sort of little game going on a CRT, so visitors could have some "hands-on" interaction with the hardware? He and his associates fashioned a tennis game, played on the five-inch screen of an oscilloscope.

Digital computers were coming into their own in 1958; in fact, Willy's own

CIRCLE 156 ON READER SERVICE CARD

A few miles up the road, Shoreham Nuclear Power Station.

Instrumentation Division was building one at the time. However his game contraption made use of an analog computer, one that used variable voltages rather than on-off pulses to represent information. To this was hardwired a nonprogrammable assemblage of electromechanical relays, potentiometers, resistors, capacitors, and "op-amps," short for operational amplifiers.

Willy himself is the first to admit that the arrangement was rather inelegant. But he also points out that it worked. He did make use of some recently invented transistors as flip-flop switches—a harbinger of things to come. Willy simply did the job in the shortest time with whatever parts were handy. The result was a video game, something no computer, digital or analog, had been harnessed to do before.

The screen display was a side view of a tennis court. It looked like an upside-down "T," with a shortened stem. This was the "net." Each player held a prototypical paddle, a small box with a knob and button on it. The knob controlled the angle of the player's return, and the button chose the moment of the hit. A player could hit the ball at any time, providing it was on his side of the net. Gravity, windspeed, and bounce were all portrayed. For example, if you hit a ball into the net, it would bounce lower than a bounce off the "ground," and would eventually die.

The game was simple, but fun to play,

and its charm was infectious. Potter remembers the popularity of the game: "The high schoolers liked it best. You couldn't pull them away from it." He's probably remembering young Dave Ahl, staring at the screen with a little voice inside him saying "this could be important."

The ball and court lines were drawn and redrawn sequentially, at a rate that made for a flicker-free view of ground, net, and ball. This is an approach still used in game playfield display. However the method of ball manipulation was and remains unique.

***The game was simple,
but fun to play,
and its charm was
infectious.***

Without becoming too bogged down in explanation, consider the following. An oscilloscope is capable of generating cartesian coordinate displays. That is to say, a dynamic "graph" can be drawn, plotting the deflection of x or y proportionally to the voltages input as x or y.

Higinbotham rigged up a circuit where in the plot of these functions simulated the trajectory of a bouncing ball. Op-

amps from a Donner Labs analog computer were used to generate this trajectory and to sense when the ball had struck the ground. When this occurred, a relay would be thrown, reversing the polarity of another op-amp, so that the ball would reflect its path and "take a bounce." Primitive, but effective.

Other op-amps and relays were used to determine whether or not the ball had hit the net. As mentioned earlier, rebound velocity from the net was lower than from the ground, providing an extra bit of realism.

Velocity, slowed continually by wind-speed, was simulated straightforwardly with a 10 meg. resistor.

A toggle switch allowed players to choose which side to serve from, and net height, as well as court length, were adjustable. There was no way a player could "miss" the ball, as a push of the paddle button would always result in a hit when the ball was on that player's side of the net. Unless the player chose the correct angle and timing for a return, however, the shot would not make it back to the opponent's side.

The implementation was very much more sophisticated than the first "Pong" games. It was the hit of the Brookhaven "visitors' days" for two years running. Eventually, however, it was dismantled.

I asked Willy why he hadn't patented the thing at the time. He is responsible for over 20 patents, each of which reverted to the U.S. Government.

This must be the place.

Dave Potter (left) and Willy worked on the original design.

Willy describes the innards of his electronic tennis game. His rendering of the screen appears at right.

COMMODORE 64 CALL FOR BEST PRICE

The Commodore 64 is a compact unit (will fit into briefcase). Full size typewriter keyboard, high res. color, this computer is the major breakthrough you've been waiting for.

- 64K Built in RAM • CP/M option
- Upper/lower case • Graphics characters
- TV interface • Music synthesizer
- 40 col. color display • "Smart" peripherals
- Cartridge game slot

The Commodore 64 can use the VIC or CBM/Pet Accessories.

Our yellow pages make the competition go green.

There's no recession at Alpha Byte. Our business is booming.

In the past year alone, our sales have increased ten-fold. And they're still on the rise.

We believe it's because we offer a unique combination of low prices and outstanding service — a package of knowledgeable salespeople, quick and efficient shipping, convenient payment options and a guarantee of satisfaction — at below-competitive prices!

Our satisfied customers are spreading the word.

We built a reputation, and a booming business, on our prices and your satisfaction. It's no wonder the competition is envious.

To order or for information call
(213) 706-0333
Modem order line: (213) 883-8976

We guarantee everything for 30 days. If anything is wrong, return the item and we'll make it right. And, of course, we'll pay the shipping charges.

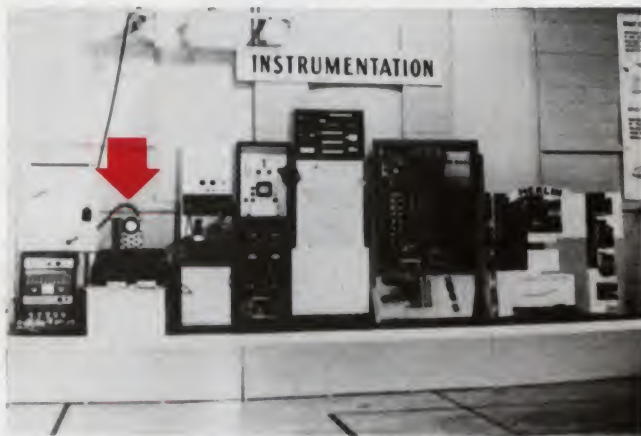

We accept Visa and Master Card on all orders; COD up to \$300.00.

Add \$2.00 for standard UPS shipping and handling on orders under 50 lbs., delivered in continental U.S. Call for shipping charges over 50 lbs. Foreign, FPO and APO orders, add 15% for shipping. Californians add 6% sales tax.

Prices quoted are for stock on hand and subject to change without notice.

31245 LA BAYA DRIVE, WESTLAKE VILLAGE, CALIFORNIA 91362

CIRCLE 105 ON READER SERVICE CARD

The oscilloscope on which the game appeared.

"We knew it was fun, and saw some potential in it at the time, but it wasn't something the government was interested in. It's a good thing, too. Today all video game designers would have to license their games from the federal government!" The idea somehow pleased Willy, and his laughter signalled it.

To Magnavox, however, the rights to video games are no laughing matter; they could mean millions. The corporation seeks a patent on video games using bouncing balls, and has taken sworn depositions from Higinbotham concerning his own invention. Though Willy stands to make no monetary gain whatsoever, he has a personal stake in the contest.

One must take a broader view of Willy's career to see the tennis game from the perspective that he himself does.

Higinbotham was a graduate student in Physics at Cornell University at the outbreak of World War II. He was invited to join research at the MIT Radiation Laboratory, where he worked on an advanced and important technique known as radio detecting and ranging, later shortened to RADAR.

From there he joined the Manhattan District Project, working as a physicist on

another exotic and potentially important technology. He became head of the Electronics Division there in 1945. Higinbotham devised the timing circuits that took the first atomic bomb through the last few milliseconds preceding detonation.

"We knew it was fun, and saw some potential in it at the time, but it wasn't something the government was interested in."

He worked with and knew J. Robert Oppenheimer quite well. "He was a charismatic man," says Willy. "People tended either to worship or detest him. I did neither. He was brilliant, though. There's no doubt of that."

At the time of the blast at Los Alamos, Willy was 24 miles from ground zero,

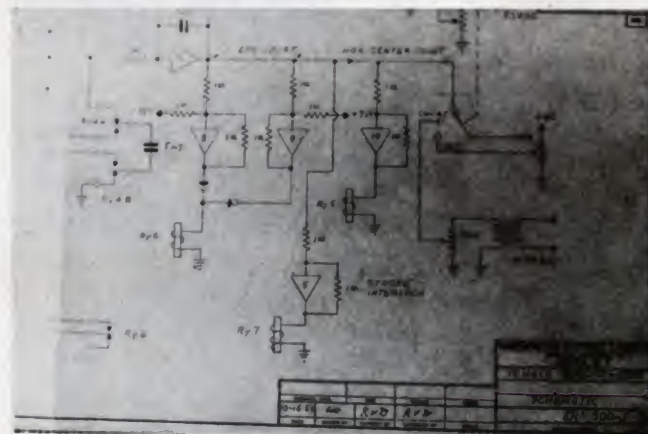

able to watch the entire detonation through welder's glass so thick, he couldn't see an illuminated headlight through it.

I asked him what it had been like. He grew quiet. He said that he and the other observers got into the trucks and made the long trip back to the compound in utter silence. No one had anything to say.

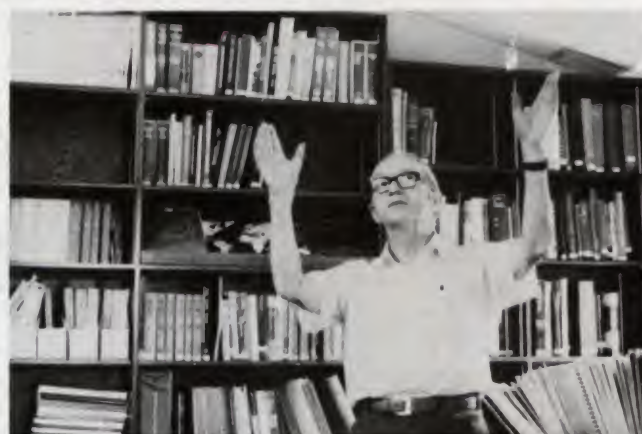

Willy spent the next two years as executive secretary of the Federation of American Scientists, in Washington, D.C. He acted as a liaison between Congress and scientists, lobbying for the nonproliferation of nuclear weapons.

"It's taken over thirty years," Willy observes, "but the message is finally beginning to get through." His face brightens. Today, as a senior scientist at Brookhaven Laboratory, he and his colleagues have amassed the largest and most comprehensive library in the world concerning nuclear safeguards.

I was warming up the car for the long trip home, staring across a field at the building housing the cyclotron. He's not only something, I thought to myself. He's a walking bit of history. He also invented the video game! □

Note the date of the blueprint: Oct. 1958. This date has been verified.

Willy describes the sight at Alamogordo in 1945.

just to talk
to your printer?

Your computer talks faster than your printer can listen. Expensive time is lost forever. SPOOL/64, a 64k byte hardware print spooler, keeps your computer processing while your printer is printing. No more waiting. No more wasting.

SPOOL/64 buffers your print output and transmits the information to your printer at the printer's specific print rate. It buffers up to 13 minutes of print output (at 80 characters per second).

SPOOL/64 plugs directly into both your printer and

computer, accepts input from parallel centronics cables (serial RS-232 available soon), and its user programming feature allows you to download your own programs so SPOOL/64 can handle sophisticated print

routines. And SPOOL/64, used with your software spooler, can give you the highest performance spooling available.

SPOOL/64 utilizes 64k of dynamic RAM, a Z-80 CPU, a 2716 ROM and a copy of the source program for the object code in the ROM is included.

SPOOL/64, priced at just ~~\$399~~ **\$319**, is the most cost/effective print spooler on the market. Evaluate performance. Evaluate price. Then let SPOOL/64 get your computer back talking to you. Call or write Apparat today for a free brochure. Dealer inquiries invited.

BASED ON INCREASED
PRODUCTION WE HAVE LOWERED
THE PRICE 20%. SPOOL/64 NOW \$319.

Add a Joystick to Your TRS-80!

Marc B. Stanis
and
David H. Ahl

Are your fingers as uncoordinated as mine when you try to play *Scarfman* or *Robot Attack*? Somehow, I just don't seem to be able to remember which fingers are controlling up and down movement and which are controlling right and left. And then remembering to fire with my thumb; by this time I'm all thumbs.

This article describes how to add a joystick to a TRS-80 Model I or III in an hour or so for the bargain price of around \$15. The joystick is completely compatible with all software (Basic and machine language) that uses the four arrow keys to move and the space bar to shoot.

Since the joystick parallels the keyboard, it doesn't require a power supply. It need not be disconnected after use, nor does it contain any electronic parts. If, for some reason the joystick malfunctions, your computer isn't in danger. At worst, you might have to replace the joystick.

Before you begin construction, read through this entire procedure and be sure you understand it. You will need the parts listed in the table. You should also be aware that this installation will void the warranty on your computer and that it will have to be removed if the computer ever needs servicing by Radio Shack. Even if the modification has been removed the warranty is still void.

Atari joysticks which connect to the ribbon PC connector at the back of the TRS-80 are available from Big Five and Alpha. These do not void the warranty and work with many, but not all games. If you are leery about voiding your warranty we strongly recommend one of these products even though they are slightly less versatile than the one described in this article.

Examine the Joystick

The first step is to remove the four Phillips head screws from the bottom of the Atari joystick case. Remove the stick mechanism. Be careful not to lose the small spring on the firing button. Examine the printed circuit board. The six connectors on the right side should have wires of the following colors connected to them:

Joystick Position	Wire Location	Color
Right	Top	Brown
Up	2	White
Common	3	Black
Down	4	Blue
Left	5	Green
Button	Bottom	Orange

If the wire colors do not correspond to this list, change the connectors so they do. Reassemble the joystick taking care that the firing button spring is back in place and that no wires are pinched—either between the edges of the case or between the edge of the case and the PC board.

Cut the DE-9 connector off the end of the Atari joystick cable. Starting from that end of the cable, *carefully* remove 10 to 12 inches of the outer plastic cable sheath with a sharp knife or electrical scissors. Take it slowly and be careful not to damage the six fine wires.

After removing the cable sheath, examine each of the six wires over its entire length to make sure it has not been damaged. If one or more have been damaged, you will have to replace them with fine (24 gauge) flexible wire or remove more of the cable sheath to get 10 to 12 inches of intact wire.

Next, strip off the insulation from the end 1/8" of each wire. Tin the ends of each wire, i.e., with a hot pencil soldering iron, apply a small amount of solder to the tip of each wire. This will make them easier to solder to the PC board in the

next step. Apply heat and solder quickly so you do not melt any of the insulation. Inspect your work and set the joystick aside.

Into the Computer

Next you are going to open the computer. Be sure you are working in a static-free location, no rugs, cats, etc. Ground yourself out before starting work by grabbing a water pipe, grounded case of a three-wire power tool, etc.

Remove the screws from the bottom of your computer and remember which screw came from which hole. Label them if necessary. (**Note: Opening your computer voids the warranty.**) If you have a Model I, lift off the bottom of the case and set it aside. *Carefully* flop the PC board in the direction of the wire connector. This exposes the bottom of the printed circuit board of the keyboard.

If you have a Model III, after removing all the screws, turn the computer right side up. Lift the top off and tip it onto the left side leaving all the wires connected. Remove the six screws holding the keyboard cover and set the cover aside. Tip the keyboard forward.

Look at the etching on this PC board. Near each pair of connections (representing each key) is a small silver etching of the name of the key (Model I) or a number (Model III). On the Model I, the second row down on the left, you should find the right and left arrow keys while the rightmost keys in the second and third rows are the up and down arrow keys. Of course, the spacebar is at the bottom. On the Model III everything will be reversed since the keyboard is effectively upside down.

Figures 1 and 2 show the three portions of the etchings on the PC board around the keys of interest. Match this with your keyboard. Solder the colored wires to the connections indicated on Figures 1 or 2.

Get Omni quality
for as little as \$1.99...
even if all you
want is a
10 pack.

Call toll-free for great savings on Omni's complete line of 5¼" premium disks. Each is certified error-free at a minimum of twice the error threshold of your system. Each is rated for more than 12 million passes without disk-related errors or significant wear. And each is precision fabricated to exceed all ANSI specifications with such standard features as reinforced hub rings and Tyvec sleeves. Get same day shipment and an unconditional, no hassle money-back guarantee.

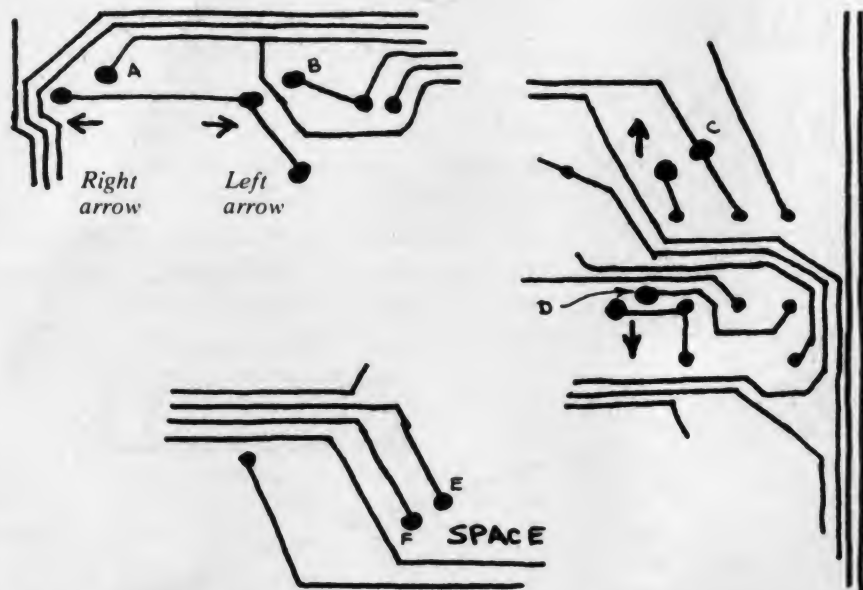

Figure 1. Portions of the TRS-80 Model I keyboard by the arrow keys and spacebar.

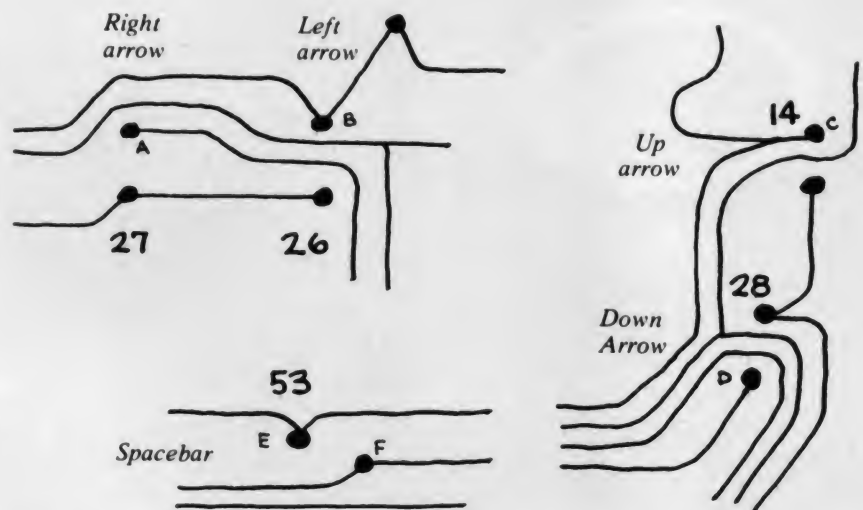

Figure 2. Portions of the TRS-80 Model III keyboard by the arrow keys and spacebar.

Make connections as indicated:

A	Brown	D	Blue
B	Green	E	Orange
C	White	F	Black

Solder these connections by touching the tip of the soldering pencil to the solder blob until it starts to melt (two seconds or so), inserting the tinned end of the wire and quickly removing the soldering pencil. Blow on the connection immediately. Following this procedure should insure that none of the wire insulation melts. If some insulation melts and the exposed wire could possibly touch another connection, unsolder it, cut off the end, tin it, and try again.

Decide where you want the joystick cable to come out of your computer. Model I owners can snake it out through the rectangular ribbon connector hole on the back left of the case although it is difficult to put a strain relief on the cable at this point. A better choice might be the front or either side of the case which choices are also open to Model III owners. With a sharp knife or rat-tail file, cut a small 1/8" notch in the case of the computer.

Back Together Again

Tie a knot in the cable close to the end of the remaining sheathing. Alternatively, you may put a small cable clamp on at this point. Snake the wire to the notch and, with the knot or cable clamp on the inside, reassemble the computer case. When doing this, be sure all the spacers between the PC boards are where they belong, check that nothing is pinched and use the correct screws.

Now comes the moment of truth. Turn on the computer (video display first, if a Model I). If you don't see the normal startup message, immediately turn off the computer; something is wrong. The problem is probably that something is pinched since even gross mistakes in soldering or a shorted connection on the keyboard will not cause a non-startup condition. Re-check everything (keyboard connections, damaged insulation, stray solder blobs, pinched wires, etc.) and reassemble.

After a proper start, try the joystick. Pressing the fire button should print spaces. The up position should print up arrows (Model I) or left brackets (Model III). The left position should print backspaces. The right position should print tabs while the down position should produce a carriage return/line feed. If you get any but these results, open the case and check the connection(s) to the keys which are not responding correctly. Reassemble and try again.

The cable on the Atari joystick is about 40" long; we have used about 12" of it inside the computer which leaves a 28-inch cable. If you feel that this is long enough (it should be for most purposes) and you don't mind having the joystick permanently connected to the computer, then just stop here. You are finished.

On the other hand, if you want a removable joystick or a longer cable, you will have to cut the cable and install male and female connectors and, if you wish, a longer cable. You can choose any one of many in-line connector sets (Cinch-Jones, D.I.N., etc.). Flexible six-conductor cable isn't so readily available and you might have to settle for ribbon cable. Some electronics outlets carry coiled six-conductor microphone cables (for CB and ham replacement use) which is perfect.

Obviously the rule to follow when installing an in-line connector set or longer cable is to maintain the integrity of each wire. When you are done, pushing the joystick left should still act as a left arrow keystroke, the fire button should be a spacebar stroke, and so on.

All done? Load in *Scarfman* or *Robot Attack* or your favorite shoot-'em-up game and you will be amazed. Never thought you could score that high, eh? □

Joytricks

John Anderson

Ever stare at the controller jacks in the front of your Atari computer and imagine all sorts of exotic hardware to connect up to it? I have, and while my work on a fully articulated robot arm is progressing quite slowly, there are a few modification projects I've undertaken that require little time, cost very few dollars, and provide nice results.

End Discrimination Against Lefties

As a left-handed gamesman, I've long suspected that my scores have been held down by the fact that joysticks are designed for righties. It's a very simple matter to turn a standard issue Atari joystick (fire button top left) into a lefty stick (fire button top right).

When you disassemble the joystick, be careful not to lose any of the screws or the little spring that sits in the trigger button. Hold the circuit board so it resembles the configuration in Figure 1. Note: newer Atari joysticks have all the connectors on one side of the PC board while older ones have three connectors on each side.

The leads must be removed from the board (grasp the collars; do not pull on the wires themselves) and reattached as shown. That's all there is to it—except to prominently label your new lefty joystick

so that it does not drive some poor righty mad. The stick is now "referenced" with the trigger to the upper right.

A Pushbutton Peripheral For Under \$8

I've been thinking about a homebrew controller jack peripheral for quite some time now, but the genesis of this idea really belongs to Rick Rowland. Though the controller is at its best when playing a

***The idea is simple:
create a panel of
pushbuttons to control
all joystick functions.***

limited number of games, you can do quite a bit with it. If you have a joystick that has seen better days and is ready for retirement, you can reincarnate it as a pushbutton peripheral.

The idea is simple: create a panel of pushbuttons to control all joystick functions. The Asteroids you'll find in arcades,

as well as Space Invaders, Galaxian, and other games, use button rather than joystick input. You can open up this realm at home with a few parts readily available at Radio Shack, and the cord from an old stick (you may try finding a DE-9 plug at an electronics store, and making a cord yourself).

You need only a few short snips of wire, some switches, and a box to mount it all in. I used three packages of push button switches (Radio Shack catalog #275-609). These are momentary contact switches, packed two to a package. I mounted five of them in a deluxe project case (Radio Shack #270-222). The total cost of these items was under \$8.00, and created a new and enjoyable input device.

Probably the toughest thing about the whole project is putting the mounting holes into the project case. If you don't have access to a drill with a suitably sized bit or hole cutter, you can do what I did: use your soldering iron to start the hole, and then ream it to size using the blade of a scissors. The two tricks to this technique are to work slowly, constantly checking the diameter of the hole against the switch collar, and not burning and/or cutting yourself. It can be done, and that's an advantage of a plastic project case

POWER

Professional Software Introduces

POWER

by Brad Templeton

ADD **POWER** TO YOUR COMMODORE COMPUTER

\$89.95

POWER produces a dramatic improvement in the ease of editing BASIC on Commodore's computers. POWER is a programmer's utility package (in a 4K ROM) that contains a series of new commands and utilities which are added to the Screen Editor and the BASIC Interpreter. Designed for the CBM BASIC user, POWER contains special editing, programming, and software debugging tools not found in any other microcomputer BASIC. POWER is easy to use and is sold complete with a full operator's manual written by Jim Butterfield.

POWER's special keyboard 'instant action' features and additional commands make up for, and go beyond the limitations of CBM BASIC. The added features include auto line numbering, tracing, single stepping through programs, line renumbering, and definition of keys as BASIC keywords. POWER even includes

new "stick-on" keycap labels. The cursor movement keys are enhanced by the addition of auto-repeat and text searching functions are added to help ease program modification. Cursor UP and cursor DOWN produce **previous** and next lines of source code. COMPLETE BASIC program listings in memory can be displayed on the screen and scrolled in either direction. POWER is a must for every serious CBM user.

IF YOU'RE WAITING FOR THE PRICE OF WORD PROCESSORS TO FALL WITHIN REASON,

IT JUST DID.

Everyone expected it would happen sooner or later... with **WordPro PLUS™** it already has! Now all the marvelous benefits of expensive and advanced word processing systems are available on Commodore computers, America's largest selling computer line. WordPro PLUS, when combined with the new 80 column CBM 8032, creates a word processing system comparable to virtually any other top quality word processor available—but at savings of thousands of dollars!

New, low cost computer technology is now available at a fraction of what you would expect to pay. This technology allowed Commodore to introduce the new and revolutionary CBM 8032 Computer.

WordPro PLUS turns this new CBM 8032 Computer into a sophisticated, time saving word processing tool. With WordPro PLUS, documents are displayed on the computer's screen. Editing and last minute revisions are simple and easy. No more lengthy re-typing sessions. Letters and documents are easily re-called from memory storage for editing or printing with final drafts printed perfectly at over five hundred words per minute!

Our nationwide team of professional dealers will show you how your office will benefit by using WordPro PLUS. At a price far less than you realize.

Figure 2.

"Arcade" Style

"Clock-Directional" Style

T = Trigger
L = Left
R = Right
D = Down (Hyperspace)
U = Up (Thrust)

(another is its low price).

Refer to Figure 2 for possible button configurations. The first is the "classic" Asteroids format. If you're building a peripheral just to play Asteroids, this is the way to go. The second is what we might call a "clock-directional" format, which in the long run proves to be a more versatile set-up. I made up one of each, and prefer the clock-directional arrangement for a variety of games.

You will need a groove in the box portion of the case to allow the cord to

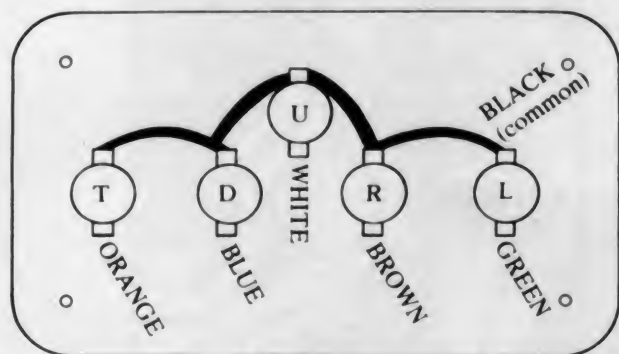

pass through. You may again use the soldering iron to do this, making the groove only wide enough to push the retaining collar in. This way it won't be easy to yank the wire out by its roots.

In order to wire up the new peripheral, refer to Figure 3. As far as I know, this color scheme is standard. In order to attach connectors to the pushbuttons, you'll want to press each connector lightly between the jaws of a pliers. If you are careful about this, you will create a good connection without losing the ability to

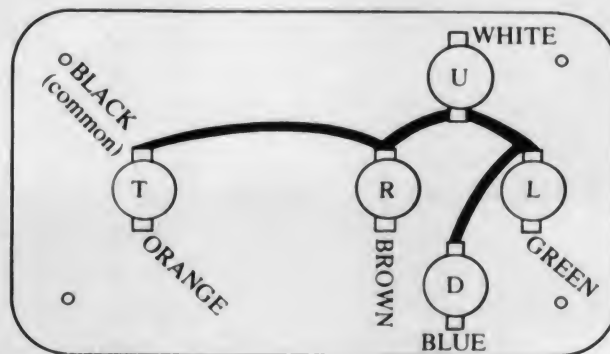

remove the cable later. Those of you who wish to make your own cord will have to find a DE-9 connector, (which may not be easy), and wire it as shown in Figure 4.

Necessarily, diagonal motion is tough with this configuration, as it requires two buttons to be pressed simultaneously. As a result, games in which the player moves in one dimension are especially suited for pushbutton input (Asteroids is a notable exception). If you feel really brave, try it with a maze game, like *Jawbreaker*.

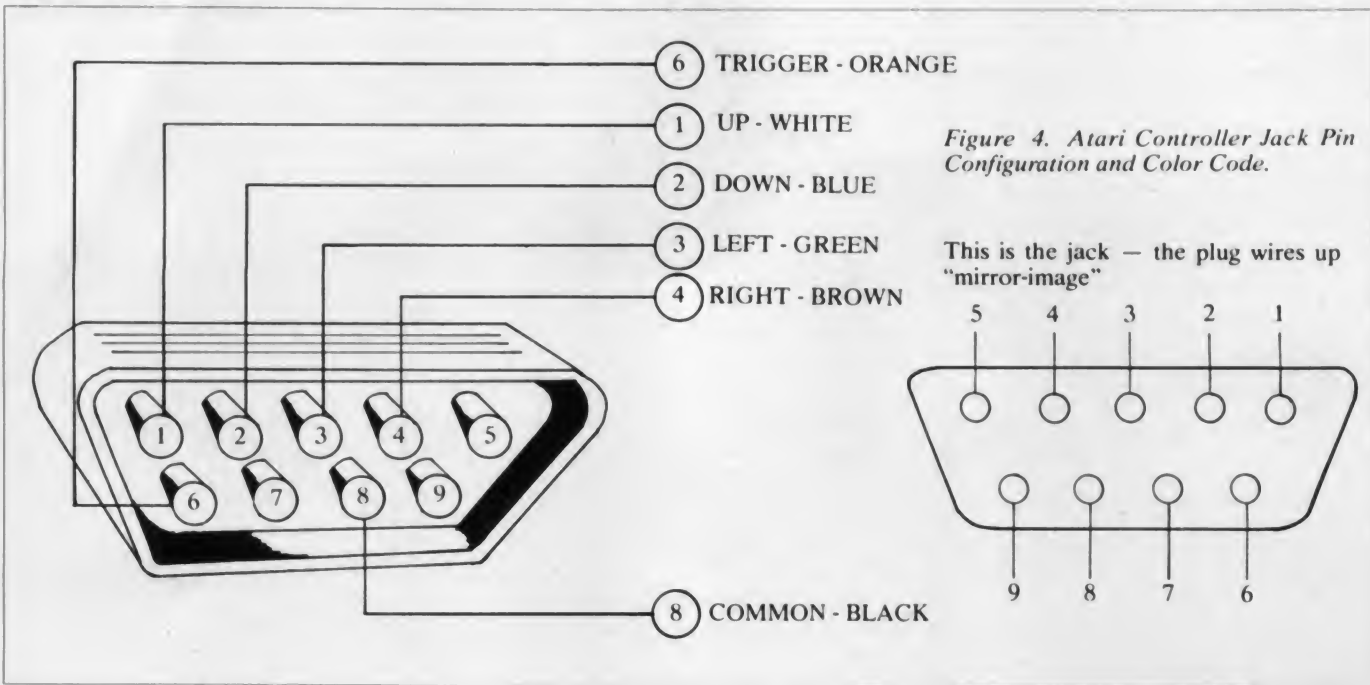

Figure 3. Flip-Side Wiring Diagram.

"Arcade" Style

"Clock-Directional" Style

Double Your Fire Power

If you construct a pushbutton peripheral with the parts I've listed above, you will have an extra button left over. It is a relatively simple matter to attach this button to the handle of an existing joystick, thereby adding a second trigger in a very handy place. It's nice to be able to fire with the same hand that steers, and because the conventional trigger remains enabled, you can easily squeeze off more shots this way.

Use a blade of your trusty (and by this

time, quite dull) scissors to press a hole through the top of the stick. Next, disassemble the stick, following the instructions given above for the "lefty" modification. Remove the white plastic stem from inside the handle. Using a saw or serrated kitchen knife, cut off about a half an inch from the top of the stem. This will provide the needed room for the switch.

Unscrew all collars and retainers from the neck of the button. Solder two 12-inch lengths of wire to the switch con-

tacts, braiding these leads together. Pass them through the hole you made on top of the stick, and through the white plastic stem. Then screw the pushbutton directly into the top of the joystick handle. The other ends of the leads attach as shown in Figure 5. Reassemble the stick, remaining mindful of that little spring that sits on the original trigger button. You will effectively have doubled your firing ability. Remember, however, some games do not allow for excessively rapid fire play.

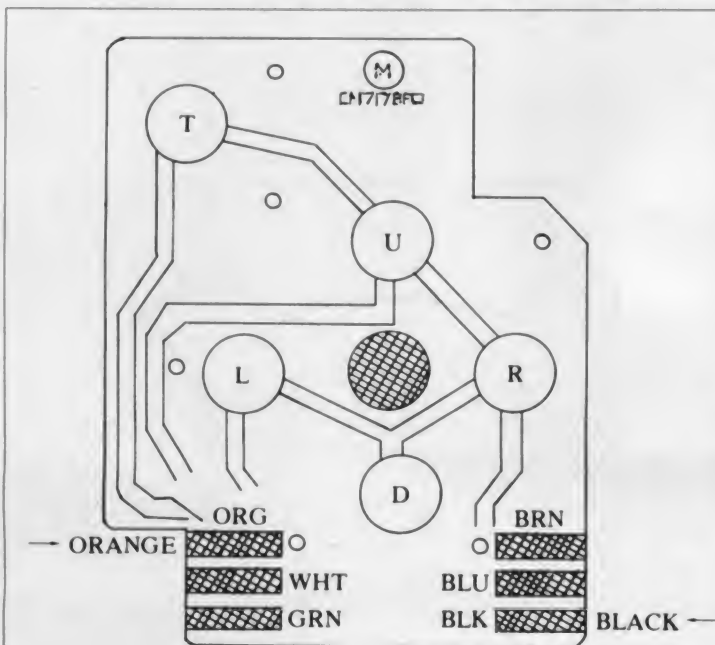

Figure 5. Second Trigger Wiring.

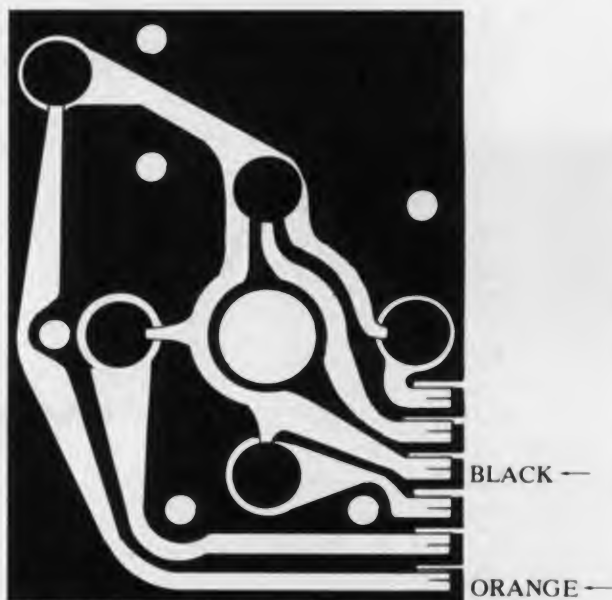

Figure 5A. New Style Stick.

Atari Game Controllers

If you like the idea of a pushbutton controller, but lack the time, talent, or inclination to construct one, you may want to purchase one of the ready-made controllers described below.

would have to withstand a few bounces off the floor. It is very large, and can be cradled or used on a tabletop by even the tiniest kids. The buttons themselves sit in raised collars, and,

Starplex Controller

The Starplex controller from Starplex Electronics, offers an authentic "Asteroids-style" button configuration, as well as the fastest set of pushbuttons I have ever seen. In addition, an optional AA battery powers a "rapid-fire" mode, automatically repeating fire faster than you can do it by hand.

Because the pushbutton array is large and has a light touch, the controller takes a bit of getting used to. Eventually, however, I found that the lightning fast direction changes possible with Starplex resulted in higher scores.

It should be mentioned that because many games do not allow a new shot to be fired until an old one leaves the screen, the "rapid-fire" option will not always work optimally. Still, you can fire continuously merely by holding the button down, rather than having to re-press the trigger for each shot (or battery of shots). Over the long haul this reduces fatigue, and the incidence of "joystick elbow."

The unit lists for \$29.95, which is a bargain for the most authentic game of Asteroids this side of the coin-op. It improved my score on several other games as well.

Starplex Electronics, Inc., E23301, Liberty Lake, WA 99019. (509) 924-3654.

KY Enterprises

The controller offered by KY Enterprises uses a directional-style configuration, less suitable for Asteroids but more versatile overall. For those unfamiliar with the arcade configuration, it is much easier to master this logical layout.

The unit exhibits extra sturdy construction—as if its makers knew it

though not as fast as the buttons or the Starplex unit, appear to be the "regulation" coin-op standard. They are large and easy to control.

The KY Enterprises controller is priced at \$26.95, and is available in left- or right-handed models. They also manufacture controllers for the handicapped.

KY Enterprises, 3039 East Second St., Long Beach, CA 90803.

Accu-Play

A third pushbutton controller, the Accu-Play Control Board, we did not have an opportunity to test. It sells for \$29.95 from Accu-Tech Products, 10572 Swinden Ct., Cincinnati, OH 45241.

A sophisticated Z80™ based microcomputer training system. Only \$500.

The Fox is the most cost-effective and versatile microcomputer training system on the market today. At the heart of The Fox is a Z80 CPU, a chip which includes more capabilities than any other 8-bit microprocessor.

With a large memory capacity and sophistication found only in larger and more expensive units, The Fox is ideal for teaching microcomputer technology in schools, colleges and industrial training environments. Other features include extensive user prompting firmware, large digital readouts, power supply and exceptional versatility.

Compare The Fox with other low-cost microcomputers and you will agree that The Fox is the way to introduce microprocessing to your classroom, laboratory, office or home.

EDUCATORS! E&L also offers the MTP-80, a complete modular course in microcomputer technology which features The Fox.

Among the many features of The Fox are:

- Z80 CPU
- Low cost
- Large memory capacity
- Unlimited expansion with STD bus
- Serial and parallel I/O
- Large digital readouts
- Power supply included
- Solderless breadboarding area
- Stackable molded case with handle

Searching Techniques

Edward Mitchell

An Introduction to Data Structures

Part 1 of this four-part series introduced the concepts of algorithms and data structures. In this section we will explore several data structures in detail—*lists, stacks, queues, and trees*—and demonstrate their use in table searches, arithmetic expression evaluation, subroutine calls, simulations, process waiting areas in computer operating systems and in a typical application program. By choosing the correct form for the data in a problem, both memory requirements and execution time may be reduced.

This article introduces each of the data structures and illustrates some possible uses. A simple genealogical database is designed showing how tree structures and stacks are used in a real application. The program source listing for the genealogical database appears next month in Part 3. Also in Part 3, methods of programming the data structures in Basic are presented.

Data Structure Definition

A data structure is an organized collection of data. For our purposes, the smallest piece of data to be used is a simple character or integer, each made from some number of *bits* of storage. The bit, or binary 0 or 1, is the basic unit of computer memory. An integer in this article, and in many real computing systems, occupies 16 bits of storage. Most computers define a byte (usually equivalent to a single character such as A or B) as a sequence of eight bits. For example, a bit, a byte and an integer might be depicted as

Typically, these are the fundamental storage units that the computer circuitry recognizes. The software manipulates the basic building blocks to develop more complex data structures. For example, a character string is little more than a sequence of characters strung together.

S M I L E

Similarly, an array of integers is just a sequence of integer storage locations.

101 5 73 67 13 8

The building blocks of characters and integers can be combined and referenced in numerous ways to form new data types. By treating the value of an integer as the address of another integer, a new type, called the *pointer* is created. For example, in the small section of memory shown below, the value of memory cell 101 is interpreted as the location or address of another cell.

99	10
100	20
101	105
102	110
103	236
104	17
105	-1

In this case, we say that cell 101 "points" to cell 105, hence the name "pointer."

**By combining groups
of characters, integers
and pointers, new
and complex data
types are created.**

By combining groups of characters, integers and pointers, new and complex data types are created. When collections of data types are brought together, they are called a *record*. Many languages, including Pascal, PL/1, Cobol, and Ada provide language support for record structures: Basic does not.

Not Even These Guys Can Promise Complete Protection

Does your insurance?

It's a startling fact, but most homeowners insurance doesn't cover home computers with business uses. That means your valuable investment could be unprotected even while you read this. Exposed to the risks of fire, theft, even accidental damage.

SAFEWARE™ does

Introducing SAFEWARE. The new insurance designed to protect your valuable investment when others won't. Re-

gardless of use, SAFEWARE provides for full replacement coverage after a low \$50 deductible. That includes all your hardware, media, even purchased software.

For just pennies a day

You can insure the average system for just pennies a day. Find the value of your system in the table below and see just how low the price for SAFEWARE protection really is. If you need higher limits, call us toll free for a low-cost quote.

Columbia National General Agency

New SAFEWARE insurance is underwritten by the American Druggists' Insurance Company, and is offered exclusively by Columbia National General Agency. Both companies are members of the Armco Insurance Group, one of the nation's leading property and casualty insurers.

For immediate coverage

No matter what the application, you can get immediate coverage for your system with the coupon below. Mail to: Columbia National General Agency, 88 East Broad Street, Columbus, Ohio 43215. 614/224-7235. Or call the toll free number for coverage today! 800/848-0598.

An Intro to Data Structure, continued...

Lists

A *list* is a sequence of memory cells linked together by pointers. The first group has a pointer to the second group, which in turn has a pointer to the third, and so on. The basic list structure is illustrated in Figure 1. The first element of the list is called the *head* and the last element is called the *tail*. New elements are inserted into the list by setting the appropriate pointers.

In Figure 1, much of memory is used for pointers and doesn't hold any data. However, by enlarging the data area, memory usage is improved. For example, a data type made from 16 characters and a pointer appears in Figure 2, where the ratio of useful data memory to pointer memory is much higher.

In Figure 1, the only way to get to element d is to start at the head of the list at a and traverse the pointers until arriving at d. As shown, the list is only traversed in the direction of the pointers. But by adding a new pointer to each list element, called a *backpointer*, the list can be traversed in either direction. Element c can then be reached by starting at the tail and traversing the list in the reverse direction.

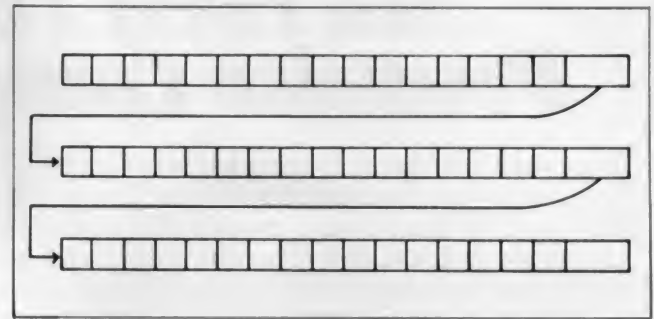

Figure 2. A problem with the list structure shown in Figure 1 is that much of the memory is used to hold pointers, rather than real data. However, if the data area for each element is enlarged, memory utilization can be improved. As shown here, when the data area per element is increased, the ratio of useful data memory to pointer memory is much higher. Of course, if the data area is not completely used, then memory utilization may still be poor.

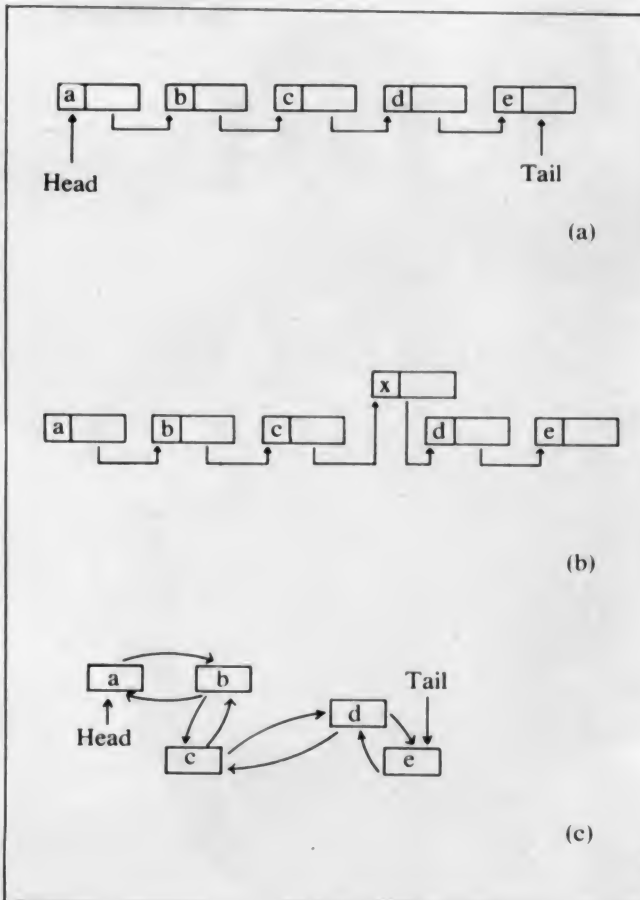

Figure 1. A list is a sequence of memory cells that are linked together. The first element is connected to the second, the second to the third, and so on, through the use of a pointer. (a) identifies the parts of a list structure. The first element is called the *head* while the last element is called the *tail*. New elements are easily inserted or deleted simply by changing the pointer connections, as shown at (b). (c) shows the addition of "backpointer" so that the list can be traversed in both directions.

Self-Organizing Lists

Lists are useful for tables that are subject to frequent changes. In Part 1, a self-organizing list structure was described as a way of sequentially searching a table ordered by the frequency of occurrence of each name. The list structure is well suited to constructing a self-organizing table. As names are added, they are attached at the head of the list. For example, when the name PAUL is added to a list already containing the names GEORGE, LISA, and BERNADETTE, the following list is produced,

To search the list for LISA, the names are examined in the sequence, PAUL, GEORGE, and finally LISA. Once LISA is found, the algorithm puts the name at the head of the list, giving,

Every time a name is found, it is relocated to the head of the list. Names that are accessed frequently stay near the front of the list, while seldom referenced names remain at the rear.

Stacks

Like the list, the *stack* is a structure that may grow and contract dynamically. Stacks are used for subroutine calls, recursive subroutine calls (recursive routines call themselves), arithmetic expression evaluation, sorting and searching algorithms and in many other applications. In some cases, the stack is like an array that grows in size at one end (See Figure 3). Data are always added to and removed from the top of the stack. Consequently, the most recent datum placed on the stack is also the first to be removed.

An Intro to Data Structure, continued...

Data are added by *pushing* a new element onto the stack. For example,

Data are removed by *popping* them off the top of the stack.

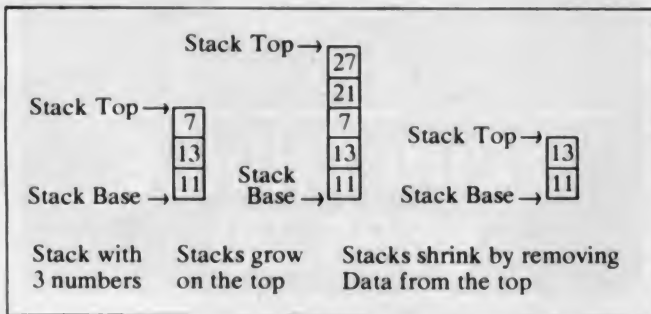

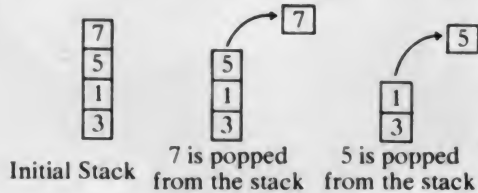

Figure 3. The stack in operation. Data are added by pushing them on to the top of the stack. When data are removed they are popped off the top. Consequently the last number put on the stack is also the first to be removed.

Stacks and Subroutine Calls

Figure 4 shows how stacks are used in subroutine calls. The Basic program shown in 4(a) calls a subroutine, which in turn calls another subroutine and so on. The output from this program is shown in 4(b).

When the program runs, the statement at line 10 calls the subroutine at line 100. When the subroutine at line 100 is completed, the program returns to line 20. Internally, the computer uses a stack to remember the return location. When it executes the GOSUB statement at line 10, it places line 20 on the stack as shown below:

20

The subroutine at line 100, in turn, calls the subroutine at line 200, placing the return location of 120 onto the stack.

120
20

By the time the program reaches line 600, the stack contains,

520
420
320
220
120
20

At line 610, the RETURN statement causes the subroutine to return to the line where it was called. So Basic pops the return address from the stack, yielding line 520. At line 520 another RETURN statement is executed, and again, the return address is popped. The program continues popping return addresses until it reaches the STOP at line 30.

```

4(c)

Figure 4. Using a stack for subroutines. When the program in (a) runs, it produces the output shown in (b). When the program reaches line 600 the stacks looks as in (c). The line numbers on the stack are the lines that Basic will go to after executing a RETURN statement. The stack allows the Basic program to jump to subroutines within subroutines without losing track of who called whom.

LET YOUR APPLE SEE THE WORLD!

The DS-65 Digisector® opens up a whole new world for your Apple II. Your computer can now be a part of the action, taking pictures to amuse your friends, watching your house while you're away, taking computer portraits . . . the applications abound! The DS-65 is a random access video digitizer. It converts a TV camera's output into digital information your computer can process. The DS-65 features:

- **High Resolution** — a 256 x 256 picture element scan
- **Precision** — 64 levels of grey scale
- **Versatility** — Accepts either NTSC or industrial video input
- **Economy** — A professional tool priced for the hobbyist

The DS-65 is an intelligent peripheral card with on-board software in 2708 EPROM. Check these software features:

- Full screen scans directly to Apple Hi-Res screen
- Easy random access digitizing by Basic programs
- Line-scan digitizing for reading charts or tracking objects
- Utility functions for clearing and copying the Hi-Res screen

Use the DS-65 for precision security systems; computer portraiture; robotics; fast to slow scan conversion; moving target indicators; reading UPC codes, musical scores and paper tape and more! **GIVE YOUR APPLE THE GIFT OF SIGHT!** DS-65 Price: \$349.95 / FSII Camera Price: \$299.00 / Combination Price: \$599.00

HI-RES PICTURE USING THE DS-65 AND PICTURE SCANNER SOFTWARE

ADDITIONAL SOFTWARE FOR THE DS-65

—**Picture Scanner:** Provides a variety of different dithering algorithms for compressing the digitized image into the Hi-Res screen. Available on 13-sector disk. Price: \$39.95

—**Superscan:** Enables you to enhance the DS-65's Hi-Res pictures with colors! Choose from 21 different colors and assign them to grey scale values, modify pictures, zoom, enhance contrast, etc. Print routines for the Anadex and Paper Tiger* are provided. Comes on a 13-sector disk. Written for The Micro Works by Magna Soft. Price: \$79.95

—**Portrait System Software:** This program includes captions and a credit line, reverse printing for T-shirt application and the option to save portraits on disk. Specifically for use with a Mailbu 165 printer. Call or write for more information.

An Intro to Data Structure, continued...

Stacks and Expression Evaluation

Stacks are used during arithmetic expression evaluation to store temporary results. Users of reverse polish notation (RPN) calculators are familiar with the notion of stacks and their use to evaluate expressions. Pressing the ENTER key is synonymous with a push onto the stack.

Consider the expression $(3+5)/(2+2)$. To solve, we add 3 and 5, giving 8, and then 2 and 2 giving 4. Then we divide 8 by 4 to give 2. During evaluation, two temporary solutions are obtained: $(3+5) = 8$ and $(2+2) = 4$. The expression might be expressed as

$$T1 = (3+5)$$

$$T2 = (2+2)$$

$$\text{Answer} = T1/T2$$

When the computer evaluates this expression, it uses a stack to store the temporary results.

Evaluating expressions by computer is quite complicated and is not described here (See Aho and Ullman [1977], Grappel, or Maurer). A parser must be constructed that distinguishes the precedence of arithmetic operations (e.g. multiply before adding). Because parsers are difficult to construct, we treat the parser as a black box that does the evaluation for us. Given the expression $(3+5)/(2+2)$, the parser begins its work at the leftmost parenthesis. Seeing the number 3, the parser places 3 on the stack to give,

3

Next, it sees the "+" symbol and temporarily saves it as the arithmetic operator. Then the 5 is placed on the stack,

5
3

The operator "+" is applied to the top two elements of the stack to give,

8

(For those with RPN calculators, this is equivalent to the sequence 3, Enter, 5, +).

Recognizing that expressions within parentheses must be evaluated first, the parser scans to the next subexpression. Both 2s are placed onto the stack, giving

2
2
8

and then added together to give,

4
8

Finally, the second number from the top of the stack is divided by the number on the top to produce the answer.

2

Queues

The line created by bank customers waiting for a teller is a queue. New customers (assuming that they are polite and do not cut in) arrive at the rear or tail of the line. When a teller is

free, a customer leaves the front or head of the line, and advances to the teller window. In computer terms, a queue is a list in which new elements are always added to the tail and always removed from the head. A queue is shown in Figure 5. Elements are added to the queue as in 5(b) and removed as in 5(c).

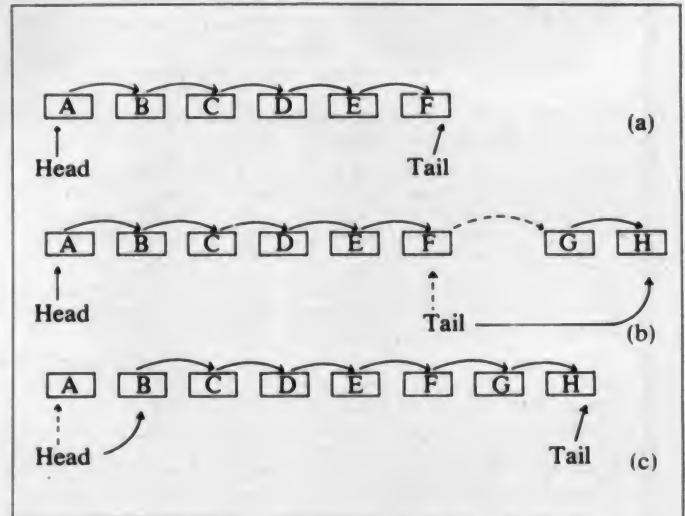

Figure 5. A queue is just like the line that customers form when waiting for service in a store. New customers wait at the end of the line while customers who have waited longest are served at the front. As a data structure, a queue is a list for which new items are always added at the tail and removed from the head. A queue is shown in (a), with A as the first element and F as the last. New elements are added at the tail, as illustrated in (b) showing the addition of two new elements G and H. Elements are always removed from the head of the queue and the head pointer is adjusted to point to the next element in the queue, as shown in (c).

Queues are often used in simulations to keep track of events. For example, in an airport simulation, aircraft are waiting for clearance to taxi to the runway, to take off, and to land. In a simulation, each of the holding points is represented by a queue structure (See Gorney [1979]) for more information about queues and simulations).

**A queue is a list
in which new elements
are always added
to the tail and
always removed from
the head.**

In a multi-user computer system, several users may wish to print simultaneously on the single line printer attached to the system. Since the printer can only print one data file at a time, additional print requests are placed into a queue where they wait for processing by the printer.

BONUS SOFTWARE SECTION!

Let us acquaint you with MESSAGE-MAKING SOFTWARE. Just place the disk in the APPLE, enter the text, and colorful, dynamic messages appear on the screens of TV sets connected to the computer. Use the software to broadcast messages on TV screens in schools, hospitals, factories, store window, exhibit booths, etc. The following program is our latest release:

SUPER MESSAGE: Creates messages in full-page "chunks". Each message allows statements of mixed typeset, typewriter, and colors, in mixed upper and lower case. Styles range from regular APPLE characters, up to double-size, double-width characters with a heavy, bold font. Six colors may be used for each different typestyle. Vertical and horizontal centering are available, and word-wrap is automatic. Users can chain pages together to make multi-page messages. Pages can be advanced manually or automatically. Multi-page messages can be stored to disc or recalled instantly. **REQUIRES 48K & ROM APPLESOFT \$50**

APPLE PLOTS YOUR DATA & KEEPS YOUR RECORDS TOO! APPLE DATA GRAPH 2.1: Plots up to 3 superimposed curves on the Hi-Res Screen both X & Y axes dimensioned. Each curve consists of up to 120 pieces of data. Graphs can be stored to disc and recalled immediately for updating. Up to 100 graphs can be stored on the same disc. Great for Stock-market Charting, Business Management, and Classroom instruction! **REQUIRES 48K & ROM APPLESOFT \$35**

APPLE RECORD MANAGER: Allows complex files to be brought into memory so that record searches and manipulations are instantaneous. Records within any file can contain up to 20 fields, with user-defined headings. Information can be string or numeric. Users can browse thru files using page forward, page backward or random search commands. Records can easily be searched, altered or sorted at will. Files can be stored on the same drive as the master program, or on another, if a second drive is available.

Records of files can be printed, if desired. Additional modules coming are a STATISTICS INTERFACE, CHECKBOOK, MAILING LIST & DATA-ENTRY. **REQUIRES 48K & ROM APPLESOFT \$40**

APPLE LITERATURE DATABASE: Allows rapid retrieval (via keywords) of references from total APPLE literature thru 1980, on 5 25" disk. Each entry in the data base consists of the article, author-name, periodical-name, date of issue, & page nos. The database is intended to support large magazine files which would require lengthy manual searching to recover information. Annual updates will be available. **REQUIRES 48K & ROM APPLESOFT \$60**

WORDPOWER: is a simple, powerful, low cost, line-oriented word-processor program. It offers a fast machine language FIND & REPLACE. Text can be listed to screen or printer, with or without line-numbers. Lower-case adaptors are supported. You can merge files, move groups of lines, and easily add, change, or delete lines. WORDPOWER can be used to create and maintain EXEC files. It can also be used as a rapid, unstructured, information-storage and retrieval system via its rapid search capabilities. **REQUIRES 48K & ROM APPLESOFT \$50**

LABELMAKER: Allows users to quickly create address labels. A given label may be generated in any quantity from 1 to 32767. Space is allowed on labels for a personal and company name, but the space is automatically closed up if only a personal name is entered. Space is also allowed for foreign countries. The program can also generate labels for price-tags, part numbers and mail-messages such as "RUSH", "FRAGILE", etc. A self-incrementing feature allows theatre-tickets to be produced, with a date, and numbers running from a000 to 2999. An editor is provided for editing labels prior to printing. All labels may be saved to disk for instant recall. **REQUIRES 48K & ROM APPLESOFT \$35**

Above software for APPLE DOS 3.2/3.3 only. Call for BONUSes for other systems.

TO ORDER: Use phone or mail. We accept VISA, MASTERCARD, COD's, personal checks & money orders. Add 4% for credit card. Customer pays handling on COD orders. Foreign orders must be in American Dollars & include 10% for handling. Connecticut residents add 7.5% sales tax. Prices subject to change without notice.

Not responsible for typographical errors. Prices subject to change without notice.

Trees

Trees are used to organize data for searching, to represent the syntactic structure of program inside compilers, and in database management systems. A family tree, illustrated in Figure 6(a) is a tree structure showing relationships among family members.

Each of the parts of the tree has a name, as shown in 6(b). Since the tree is upside down, the top point is called the *root*, and the lines issuing downward from the root are *branches*.

Each of the branching points is called a *node* while *leaves* are found at the extreme ends of the branches. A tree with two or fewer branches at each node is called a *binary tree*. Trees containing more than two branches do exist, but are not discussed here.

An ordered table could be represented as the tree shown below:

Traversing the branches of the tree as shown by the arrows, traces the table entries in alphabetical order: A, B, C, D, E, F, G. The symbol D at the root position is at the alphabetic center of the table. Referring to Algorithm 2 in Part 1, the ordered table binary search begins at the name in the middle of the table. Similarly, the root of the tree corresponds to the middle of the table and is used as the starting position for the binary tree search.

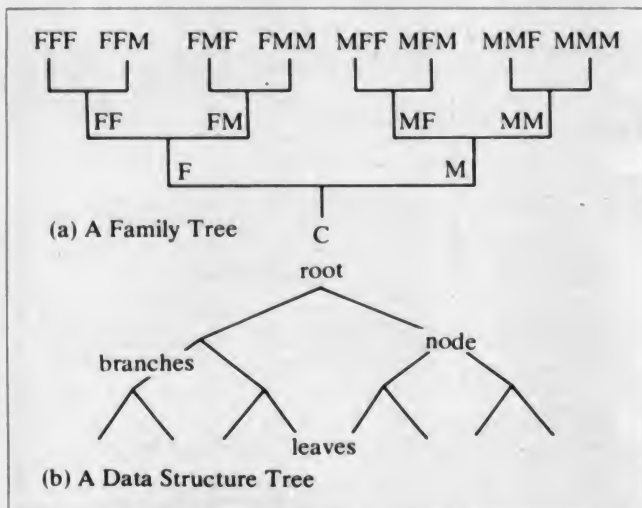

Figure 6(a). The family tree in (a) shows the relationships among family members. The child, C, is at the root of the tree, with his parents just above. The child's father's father is shown at the extreme upper left. Similar relationships are shown elsewhere in the tree. In data structures, a tree is usually represented upside down, so that C would be on the top with his father and mother just beneath. At (b) the parts of a tree are labelled using data structure terminology.

Placing the names from Part 1, Figure 3 into a tree gives the structure shown in Figure 7. In Part 1, a detailed example was given to search for the name ERIC within an ordered table. That search began with the name ERIKA at the

midpoint of the ordered table. Since ERIC was alphabetically less than ERIKA, all names greater than or equal to ERIKA could be removed from further consideration.

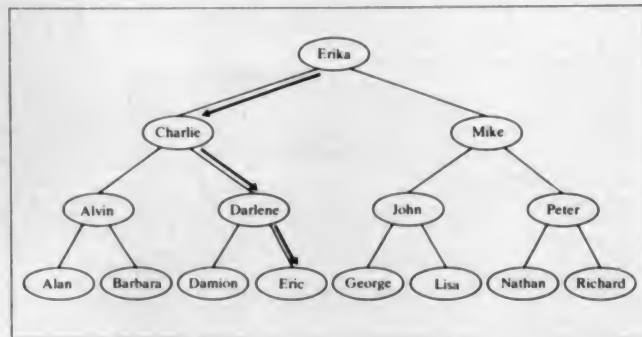

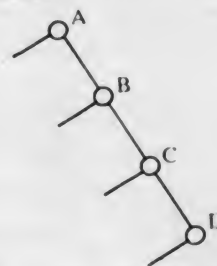

Figure 7. Searching a binary tree for ERIC. Starting at the root, ERIC is less than ERIKA so the name must lie along the left branch. But since ERIKA is greater than CHARLIE it must be to the right of CHARLIE. Eventually the search finds ERIC to the right of DARLENE in just four tries.

When the table is a tree structure, the binary search begins at the root of the tree, where ERIKA appears. Since the names appearing on the right branch from ERIKA are all alphabetically greater than ERIC, that entire branch may be removed from further consideration. The search then descends down the left branch to CHARLIE. Comparing CHARLIE to ERIC, the algorithm chooses the right sub-branch as the only possibility, so it descends to DARLENE. But since ERIC is greater than DARLENE, the search descends to the right where ERIC is found. The branches within the tree lead directly to the next guess, just as arithmetic is used to select the next guess when using the binary ordered table search.

Let's see what happens when we search for EDWARD, a name which does not appear in the tree. The search starts in the same way as does the search for ERIC, descending down the left branch from ERIKA to CHARLIE, from CHARLIE to DARLENE, and from DARLENE to ERIC. At ERIC the search tries the left but since the left branch doesn't exist, the algorithm concludes that EDWARD is not in the table.

Adding a name to the tree is simple. Since the algorithm expects to find EDWARD to the left of ERIC, it attaches a new leaf and places EDWARD at that point. If the names are entered into the tree in a bad order, such as alphabetical order, the tree can become extremely lopsided, taking on the appearance of a list:

Fortunately, Knuth has shown that if we assume the names to be entered in random order, the tree will probably organize into a structure that is close to being optimum.

A Practical Application

Genealogists often need to find the name, birth date, or place of birth of a distant ancestor. A question such as, "Who

Hard Disk Drives

12 MEGABYTE SUB-SYSTEM - DayStar

12 Megabyte Winchester sub-system for most CP/M based microcomputers including Apple II, S-100, IBM PC, NEC, Xerox, TRS-80 II, Heath H-89, and others. Sub-system includes interface, controller, cabinet, power supply, CP/M software patch, & cables - ready to just plug in and run. A 1 Megabyte back-up drive is also available.

MSH-531010 S-100 sub-system \$2095.00
MSH-531020 Apple II sub-system \$2095.00
MSH-531030 NEC sub-system \$2095.00
MSH-531040 Xerox sub-system \$2095.00
MSH-531050 TRS-80 II sub-system \$2095.00
MSH-531060 IBM PC sub-system \$2095.00
MSH-531099 1 Megabyte back-up \$699.95

12 MEGABYTE WINCHESTER - Tandon

5 1/4" hard disk drive for hi-speed mass storage.
MSH-550603 Bare 5 1/4" drive \$1094.95

Letter Quality Printers

TP-1 LETTER QUALITY - SCM

10 CPS daisy wheel printer from Smith Corona.
PRD-45101 Centronics parallel \$699.95
PRD-45102 RS-232C serial \$749.95

LETTER QUALITY PRINTER - Jade

Uses standard daisy wheels and ribbon cartridges, 16 CPS bi-directional printing, semi-automatic paper loader (single sheet or fan fold), 10/12/15 pitch, up to 16" paper, built-in noise suppression cover.

PRD-11001 Centronics parallel \$959.95
PRD-11002 RS-232C serial model \$999.95

STARWRITER F-10 - C. Itoh

New 40 CPS daisy wheel printer with full 15" carriage, uses standard Diablo print wheels and ribbons, both parallel and serial interfaces included.

PRD-22010 Starwriter F-10 \$1495.95

80 CPS LETTER QUALITY - Fujitsu

High speed daisy wheel printer with both RS-232C serial & Centronics parallel interfaces, emulates NEC 5510, Diablo 630, Qume, and will interface to the IBM Personal Computer, features include Z-80 CPU, 16K buffer (48K optional), bi-directional printing, & baud rates up to 19.2K

PRD-86100 Fujitsu with 16K \$2895.00
PRD-86200 Fujitsu with 48K \$3195.00
PRA-86000 Adjustable tractor \$190.00

Software

PLANNER CALC - Target Software

Spread sheet (what if ?) program designed with the user in mind, user oriented (simple english) commands allow you to quickly master this powerful software package, supplied on disk for most CP/M based systems.

SFA-12251052M Apple II 5 1/4" CP/M \$49.95
SFC-12251050F SS SD 8" CP/M \$49.95
SFC-12251053F Xerox 8" CP/M \$49.95
SFC-12251053M Xerox 5 1/4" CP/M \$49.95
SFX-12251051M NEC 5 1/4" CP/M \$49.95

PAC MAN - Atari

Atari's best selling game for your 800 or 400 computer.
SFI-31254022E Pac Man cartridge \$37.95

JADE Computer Products

4901 W. Rosecrans, Hawthorne, Ca 90250

TERMS of SALE: Cash, checks, credit cards, or Purchase Orders from qualified firms and institutions. Minimum Order \$15.00. California residents add 6% tax. Minimum shipping & handling charge \$3.00. Pricing & availability subject to change.

Disk Drive for Apple \$319.95

Diskettes

PREMIUM DISKETTES - Jade

We proudly put our name on these high quality diskettes -

5 1/4" Diskettes, Box of Ten		
MMD-5110103	SS, SD, 01S	\$29.00
MMD-5111003	SS, SD, 10S	\$29.00
MMD-5111603	SS, SD, 16S	\$29.00
MMD-5120103	SS, DD, 01S	\$31.00
MMD-5121003	SS, DD, 010	\$31.00
MMD-5121603	SS, DD, 16S	\$31.00

8" Diskettes, Box of Ten		
MMD-8110103	SS, SD, 01S	\$31.00
MMD-8120103	SS, DD, 01S	\$39.00
MMD-8220103	DS, DD, 01S	\$48.00

BARGAIN DISKETTES		
MMD-5110105	5 1/4" SS, DD, 01S	\$19.95
MMD-5220105	5 1/4" DS, DD, 01S	\$32.95
MMD-8110105	8" SS, SD, 01S	\$24.95
MMD-8120105	8" SS, DD, 01S	\$32.95
MMD-8220105	8" SS, DD, 01S	\$35.95

Video Monitors

HI-RES 12" GREEN - Zenith

15 MHz bandwidth with 700 lines/inch. P31 green phosphor, switchable 40 or 80 columns, small, light-weight & portable.
VDM-201201 List price \$189.95 \$129.95

12" GREEN SCREEN - NEC

20 MHz bandwidth, P31 phosphor ultra-high resolution video monitor with audio.
VDM-561200 List price \$289.95 \$199.95

12" COLOR MONITOR - NEC

High resolution color monitor with audio.
VDC-651212 Color monitor \$389.95
NEC-1202D RGB color monitor \$999.95

13" COLOR MONITORS - BMC

18 MHz RGB & composite video color monitors.
VDC-421320 13" RGB Color \$329.95
VDC-421310 13" Composite video \$299.95
VDX-420090 RGB card for Apple \$149.95

COLOR MONITORS - Amdek

Reasonably priced color video monitors.
VDC-801330 13" Color I \$379.95
VDC-801320 13" Color II \$894.95
IOV-2300A DVM board for Apple \$199.95

AMBER or GREEN MONITORS - Jade

High resolution 18 MHz compact video monitors.
VDM-751210 12" Amber phosphor \$149.95
VDM-751220 12" Green phosphor \$139.95
VDM-750910 9" Amber phosphor \$149.95
VDM-750920 9" Green phosphor \$139.95

Modems

SIGNALMAN - Anchor

Direct-connect automatic answer/originate selection, 300 Baud full duplex, Bell 103, includes RS-232 cable
IOM-5600A Signalman \$98.50

SMARTMODEM - Hayes

Sophisticated direct-connect auto-answer/auto-dial modem, touch-tone or pulse dialing, RS-232C interface, programmable
IOM-5400A Smartmodem \$248.95
IOM-1500A Hayes Chronograph \$218.95
IOM-2010A Micromodem II \$326.95
IOM-1100A Micromodem 100 \$368.95

EPROM Erasers

ULTRA-VIOLET EPROM ERASERS

Inexpensive erasers for industry or home.
XME-3100A Spectronics w/o timer \$69.50
XME-3101A Spectronics with timer \$94.50
XME-3200A Economy model \$39.95

Single User System

THREE BOARD SET - SD Systems

4 MHz Z-80A CPU, 64K RAM (optional 256K), serial I/O port, parallel I/O port, double density disk controller, CP/M 2.2 & manual set, system monitor, control & diagnostic software. Includes SBC-200, 64K ExpandoRAM II, Versafloppy II, & CP/M 2.2 - all boards are assembled & tested.
Board set with 64K of RAM \$1095.00
Board set with 256K of RAM \$1295.00

Apple II Accessories

16K RAM CARD - for Apple II

Expand your Apple to 64K, 1 year warranty
MEX-16700A Save \$125.00 !!! \$69.95

ADD-ON DISK DRIVE - for Apple II

Inexpensive direct replacement for Apple Disk II, works with Apple II controller as first or second drive.
MSM-123200 Add On Drive \$319.95
MSM-123100 Controller \$94.95

Z-80 CPU CARD - for Apple II

Two computers in one, Z-80 & 6502, more than doubles the power and potential of your Apple, includes Z-80 CPU card CP/M and complete manual set.
CPX-62800A A & T with software \$249.95

8" DISK CONTROLLER - Vista

New from Vista Computer, single or double sided, single or double density, compatible with DOS 3.2/3.3, Pascal, & CP/M 2.2, Shugart & Qume compatible
IOD-2700A A & T \$499.95

2 MEGABYTES for Apple II

Complete package includes: Two 8" double-density disk drives, Vista double-density 8" disk controller, cabinet, power supply, & cables, DOS 3.2/3.3, CP/M 2.2, & Pascal compatible.
1 MegaByte Package Kit \$1495.00
1 MegaByte Package A & T \$1695.00
2 MegaByte Package Kit \$1795.00
2 MegaByte Package A & T \$1995.95

APPLE-CAT - Novation

Software selectable 1200 or 300 baud, direct connect, auto-answer/auto-dial, auxiliary 3-wire RS232C serial port for printer.
IOM-5232A Save \$50.00!!! \$325.95

VISION 80 - Vista Computer

80 column x 24 line video card for Apple II, 128 ASCII characters, upper and lower case, 9 x 10 dot matrix with 3 dot descenders, standard data media terminal control codes, CP/M Pascal & Fortran compatible, 50/60 Hz
IOV-2400A Vista Vision 80 \$299.95

CPS MULTICARD - Mtn. Computer

Three cards in one! Real time clock/calendar, serial interface, & parallel interface - all on one card
IOX-2300A A & T \$179.95

HI-RES GRAPHICS CARD - Genie

Intelligent printer interface and control card allows full high resolution graphics and screen dumps.
IOP-2405A Genie for Epson \$119.95
IOP-2410A Genie for Okidata \$119.95
IOP-2415A Genie for NEC/C. Itoh \$119.95

Power Strips

ISOBAR - GSC

Isolates & protects your valuable equipment from high voltage spikes & AC line noise, inductive isolated ground, 15 amp circuit breaker, U.L. listed
EME-115103 3 socket \$39.50
EME-115105 4 socket \$49.50
EME-115100 8 socket \$54.50
EME-115110 9 socket rackmount \$74.50

Single Board Computer

SUPERQUAD - Adv. Micro Digital

Single board, standard size S-100 computer system, 4 MHz Z-80A, single or double density disk controller for 5 1/4" or 8" drives, 64K RAM, extended addressing, up to 4K of EPROM, 2 serial & 2 parallel I/O ports, real time interrupt clock, CP/M compatible.
CPC-30800A A & T \$724.95
IOX-4232A Serial I/O adapter \$29.95

Z-80 STARTER KIT - SD Systems

Complete Z-80 microcomputer with RAM, ROM, I/O, keyboard, display, kludge area, manual, & workbook.
CPS-30100K Kit with workbook \$299.95
CPS-30100A A & T with workbook \$469.95

AIM-65 - Rockwell International

Complete 6502 microcomputer with alphanumeric display, printer, keyboard, & instruction manual.
CPK-50165A 1K AIM-65 \$424.95
CPK-50465A 4K AIM-65 \$474.95
SFK-74600008E 8K Basic ROM \$64.95
SFK-64600004E 4K assembler ROM \$43.95
SFK-74600020E PL/65 ROM \$84.95
SFK-74600010E Forth ROM \$64.95
SFK-74600030E Instant Pascal \$99.95
PSX-030A Power supply \$64.95
ENX-000002 Enclosure \$54.95

SPECIAL PACKAGE

4K AIM-65, 8K Basic, power supply, & enclosure
Special Package Price \$649.95

S-100 EPROM Boards

PROM-100 - SD Systems

2708, 2716, 2732 EPROM programmer with software.
MEM-99520K Kit with software \$189.95
MEM-99520A A & T with software \$249.95

PB-1 - SSM Microcomputer

2708, 2716 EPROM board with on-board programmer.
MEM-99510K Kit with manual \$154.95
MEM-99510A A & T with manual \$219.95

EPROM BOARD - Jade

16K or 32K uses 2708 or 2716 EPROMs, 1K boundary.
MEM-16230K Kit w/o EPROMs \$79.95
MEM-16230A A & T w/o EPROMs \$119.95

S-100 Video Boards

SPECTRUM COLOR - CompuPro

Full-function color graphics board, up to 8 colors, 256 x 192 graphics, parallel I/O port, 8K RAM.
IOV-1870A A & T \$348.95
IOV-1870C CSC \$398.95

MICROANGELO - Scion

Ultra-high-resolution 512 x 480, 256 color or black & white S-100 video board
IOV-1500A A & T \$999.95

S-100 MotherBoards

ISO-BUS - Jade

Silent, simple, and on sale - a better motherboard
6 Slot (5 1/4" x 8 1/2")
MBS-061B Bare board \$19.95
MBS-061K Kit \$39.95
MBS-061A A & T \$59.95
12 Slot (9 1/4" x 8 1/2")
MBS-121B Bare board \$29.95
MBS-121K Kit \$69.95
MBS-121A A & T \$99.95
18 Slot (14 1/2" x 8 1/2")
MBS-181B Bare board \$49.95
MBS-181K Kit \$99.95
MBS-181A A & T \$139.95

ACTIVE TERMINATOR - CompuPro

A true mother's helper
TSX-100A A & T \$59.45

Prices may be slightly higher at our retail locations. Please call the store nearest you for local price and availability.

CompuPro Boards on Sale

S-100 CPU Boards

8086/8087 - CompuPro

16 bit, 8 or 10 MHz 8086 CPU with provisions for 8087 & 80130.
CPU-70520A 8 MHz 8086 A & T \$624.95
CPU-70520C 8 MHz 8086 CSC \$764.95
CPU-70530A with 8087 A & T \$1224.95
CPU-70530C with 8087 CSC \$1455.95

8085/8086 - CompuPro

Both 8 & 16 bit CPUs, standard 8 bit S-100 bus, up to 8 MHz, accesses 16 Megabytes of memory.
CPU-20510A 6 MHz A & T \$398.95
CPU-20510C 6/8 MHz CSC \$497.95

CPU-Z - CompuPro

2/4 MHz Z80A CPU, 24 bit addressing
CPU-30500A 2/4 MHz A & T \$279.95
CPU-30500C 3/6 MHz CSC \$374.95

SBC-200 - SD Systems

4 MHz Z-80A CPU with serial & parallel I/O, 1K RAM, 8K ROM space, monitor PROM included
CPC-30200A A & T \$399.95

THE BIG Z - Jade

2 or 4 MHz switchable Z-80 CPU board with serial I/O, accommodates 2708, 2716, or 2732 EPROM, baud rates from 75 to 9600.
CPU-30201B Bare board w/manual \$35.00
CPU-30201K Kit with manual \$149.95
CPU-30210A A & T with manual \$199.95

CB-2 - SSM Microcomputer

2 or 4 MHz Z-80 CPU board with provision for up to 8K of ROM or 4K of RAM on board, extended addressing, IEEE S-100, front panel compatible
CPU-30300K Kit with manual \$229.95
CPU-30300A A & T with manual \$274.95

2810 Z-80 CPU - C.C.S.

2 or 4 MHz Z-80 CPU with serial I/O port & on-board monitor PROM, front panel compatible.
CPU-30400A A & T with PROM \$289.95

2820 Z-80 DMA CPU - C.C.S.

4 MHz Z-80 CPU board with 2 serial I/O ports & Centronics parallel I/O port, separate data & status ports, DMA daisy chain compatible.
CPU-30420A A & T with manual \$569.95

S-100 Disk Controllers

DISK 1 - CompuPro

8" or 5 1/4" DMA disk controller, single or double density, single or double sided, 10 MHz
IOD-1810A A & T \$449.95
IOD-1810C CSC \$554.95
SFC-52506580F 8" CP/M 2.2 for Z-80 \$174.95
SFC-52506586F 8" CP/M 2.2 for 8086 \$299.95
SFO-54158000F Oasis single user \$499.95
SFO-54158002F Oasis multi-user \$849.95

VERSAFLOPPY II - SD Systems

Double density disk controller for any combination of 5 1/4" and 8" single or double sided, analog phase-locked loop data separator, vectored interrupts, CP/M 2.2 & Oasis compatible, control/diagnostic software PROM included.
IOD-1160A A & T with PROM \$359.95
SFC-55009047F CP/M 2.2 with VF II \$99.95

2242 DISK CONTROLLER - C.C.S.

5 1/4" or 8" double density disk controller with on-board boot loader ROM, free CP/M 2.2 & manual set.
IOD-1300A A & T with CP/M 2.2 \$399.95

DOUBLE D - Jade

High reliability double density disk controller with on-board Z-80A, auxiliary printer port, IEEE S-100, can function in multi-user interrupt driven bus.
IOD-1200B Bare board & h/wr man \$59.95
IOD-1200K Kit w/h/wr & s/wr man \$299.95
IOD-1200A A & T w/h/wr & s/wr man \$359.95
SFC-59002001F CP/M 2.2 with Double D \$99.95

S-100 Memory Boards

256K RAMDISK - SD Systems

ExpandoRAM III expandable from 64K to 256K using 64K x 1 RAM chips, compatible with CP/M, MP/M, Oasis, Cromemco, & most other Z-80 based systems, functions as ultra-high speed disk drive when used with optional RAMDISK software.
MEM-65064A 64K A & T \$474.95
MEM-65128A 128K A & T \$574.95
MEM-65192A 192K A & T \$674.95
MEM-65256A 256K A & T \$774.95
SFC-55009000F RAMDISK s/wr CP/M 2.2 \$44.95
SFC-55009000F RAMDISK with EXRAM III \$24.95

128K RAM 21 - CompuPro

128K x 8 bit or 64K x 16 bit static RAM board, 12 MHz, 24 bit addressing.
MEM-12810A A & T \$1609.95
MEM-12810C CSC \$1794.95

64K RAM 17 - CompuPro

64K CMOS static RAM board, 10 MHz, low power less than 4 watts, DMA compatible, 24 bit addressing
MEM-64180A 64K A & T \$549.95
MEM-64180C 64K CSC \$698.95

64K RAM 16 - CompuPro

32K x 16 bit or 64K x 8 bit low power static RAM board, 10 MHz, 24 bit addressing.
MEM-32180A RAM 16 A & T \$598.95
MEM-32180C RAM 16 CSC \$698.95

64K STATIC RAM - SSM

IEEE 696/S-100 standard, up to 6MHz/8 Bit, 12MHz/16 Bit, 24 Bit extended addressing, disable-able in 2K increments
MEM-64300A A & T \$499.95

64K STATIC RAM - Mem Merchant

64K static S-100 RAM card, 4 to 16K banks up to 8 MHz.
MEM-64400A 64K A & T \$499.95

2065 64K RAM - C.C.S.

4 MHz bank port, bank byte selectable, extended addressing, 16K bank selectable, front panel compatible.
MEM-64565A 64K A & T \$349.95

2066 64K RAM - C.C.S.

64K RAM board with bank and block select switching functions for Cromemco Cromix & Alpha Micro.
MEM-64566A 64K A & T \$424.95

64K EXPANDORAM II - SD Systems

Expandable RAM board from 16K to 64K using 4116 RAM chips.
MEM-16630A 16K A & T \$344.95
MEM-32631A 32K A & T \$364.95
MEM-48632A 48K A & T \$384.95
MEM-64633A 64K A & T \$399.95

MEMORY BANK - Jade

4 MHz S-100 bank selectable expandable to 64K.
MEM-99730B Bare board w/manual \$49.95
MEM-99730K Kit with no RAM \$179.95
MEM-32731K 32K kit \$199.95
MEM-64733K 64K kit \$249.95
Assembled & Tested add \$50.00

32K RAM 20 - CompuPro

32K static RAM, up to 10 MHz, disable-able in 4K banks, bank select or 24 bit addressing.
MEM-18180A 16K A & T \$259.95
MEM-18180C 16K CSC \$324.95
MEM-24180A 24K A & T \$324.95
MEM-24180C 24K CSC \$384.95
MEM-32185A 32K A & T \$384.95
MEM-32185C 32K CSC \$449.95

16K STATIC RAM - Mem Merchant

4MHz lo-power static RAM board, IEEE S-100, bank selectable, addressable in 4K blocks, disable-able in 1K segments extended addressing.
MEM-16171A 16K A & T \$149.95

S-100 I/O Boards

SYSTEM SUPPORT 1 - CompuPro

Real time clock, three 16 bit interval timers, dual interrupt controllers(15 levels), up to 4K EPROM/RAM, RS-232C serial channel, provision for 9511A/9512 math chip
IOX-1850A SS1 A & T \$359.95
IOX-1850C SS1 CSC \$459.95
IOX-1855A with 9511 A & T \$554.95
IOX-1855C with 9511 CSC \$654.95
IOX-1860A with 9512 A & T \$554.95
IOX-1860C with 9512 CSC \$654.95

INTERFACER 1 - CompuPro

2 serial I/O ports 50-19.2K baud.
IOI-1810A A & T \$218.95
IOI-1810C CSC \$288.95

INTERFACER 2 - CompuPro

3 parallel, 1 serial, & interrupt timer
IOI-1820A A & T \$218.95
IOI-1820C CSC \$288.95

INTERFACER 3 - CompuPro

5 or 8 channel serial I/O board for interrupt driven multi-user systems up to 250K baud.
IOI-1835A 5 port A & T \$558.95
IOI-1835C 5 port CSC \$628.95
IOI-1838A 8 port A & T \$628.95
IOI-1838C 8 port CSC \$748.95

INTERFACER 4 - CompuPro

3 serial, 1 parallel, 1 Centronics parallel
IOI-1840A A & T \$314.95
IOI-1840C CSC \$414.95

MPX - CompuPro

Multi-user I/O multiplexer & interrupt controller with on-board 8085A-2 CPU & 4K or 16K of RAM.
IOI-1875A 4K MPX A & T \$444.95
IOI-1875C 4K MPX CSC \$534.95
IOI-1880A 16K MPX A & T \$584.95
IOI-1880C 16K MPX CSC \$674.95

I/O-8 - SSM Microcomputer

Eight software programmable serial I/O ports, 110-19.2K Baud, ideal for multi-user systems
IOI-1018A A & T \$469.95

I/O-5 - SSM Microcomputer

Two serial & 3 parallel I/O ports, 110-19.2K Baud
IOI-1015A A & T \$289.95

MPC-4 - SD Systems

Intelligent 4-port serial I/O card, on-board Z-80A, 2K RAM, 4K PROM area, on-board firmware, fully buffered, vectored interrupts, four CTC channels, add to SD Board set for powerful multi-user system
IOI-1504A A & T w/software \$495.00

I/O-4 - SSM Microcomputer

2 serial I/O ports plus 2 parallel I/O ports.
IOI-1010B Bare board w/manual \$35.00
IOI-1010K Kit with manual \$179.95
IOI-1010A A & T with manual \$249.95

2830 6 PORT SERIAL - C.C.S.

Six asynchronous RS-232C serial I/O ports with programmable baud rates.
IOI-1040A A & T with manual \$529.95

2710 4 PORT SERIAL - C.C.S.

Four RS-232C serial I/O ports with full handshaking.
IOI-1060A A & T with manual \$319.95

2719 2 SER & 2 PAR - C.C.S.

Two RS-232C serial I/O ports plus two 8 bit parallel I/O ports.
IOI-1080A A & T with manual \$349.95

An Intro to Data Structure, continued...

is this person's great-great-great grandfather and where was he born?" may need answering. Actually, that question is ambiguous because each person has 16 ancestors who qualify as "great-great-great grandfather." The same question could be phrased as "one's father's father's father's father's father." Using that notation, each of the 16 ancestors can be uniquely identified. For example, "mother's father's father's father's father's father," or "father's father's mother's mother's father."

Questions such as these are easily answered by using a tree-structured genealogical database such as a pedigree chart.

Figures 6(a) and 8(a) show what one family tree might look like. Three functions are needed to use the database. "Add" adds a new ancestor to the tree. "Print" displays the information on one or several ancestors. "Change" modifies the information in the database. For example, you may discover that a name is misspelled or the date of birth is incorrect. A delete function is not needed; deleting your ancestors would have fatal consequences for all subsequent offspring.

A tree is a logical representation for the data.

Listing 1 shows the system in operation. A special notation references the ancestor by his or her relation to the person at the root of the tree. If the family tree has your ancestry, then your grandmother, or your mother's mother, is denoted by MM. Similarly, your mother's father is specified by MF.

When searching back several generations, typing long sequences of M and F is tedious. Instead, a short hand notation must be provided. For example, F5 can be equivalent to FFFFF. A trailing digit indicates a repeat factor for the previous character. Some more examples:

F = your father

M = your mother

FF = your grandfather

FO or MO = your self (0th father or mother)

F3M5F = FFFMMMMMF

When the program is run the first time, the database is empty. The only name that can be added is your own (see Listing 1). To add other names, you must specify the relationship to yourself. The next name after yourself may be either your father or mother, identified by either F or M.

When printing information from the tree, the program prompts for the relationship of the person whose data record you would like to see. For example, entering F2 refers to your grandfather. You can also see all of the ancestors for that particular person. Or you may wish to print the names of your grandfather's father and mother.

The number of generations to display is indicated by appending a plus sign. For example, FF1 tells the program to display your grandfather's record plus one additional generation. FF2 displays two generations beyond your grandfather. If no digit follows the plus (FF) all generations previous to the one specified are shown. Several examples of the program in operation are presented in Listing 1.

A tree is a logical representation for the data. The database is made from a series of records kept in a data file on disk. Each record contains a name, birth date and place, death date and place, and pointers to the corresponding father and

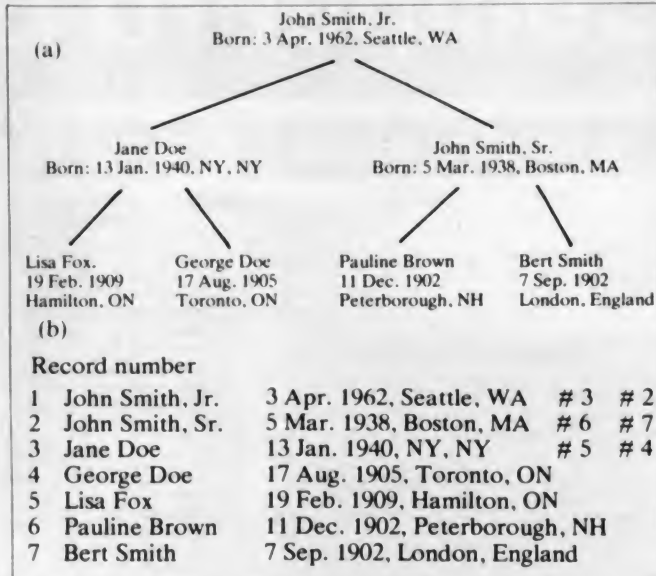

Figure 8. At (a) is a small family tree showing birth date and place for each of the family members. At (b) is the same information but translated into data records for keeping on a disk file. The numbers at the right of records 1 through 4 point to the corresponding mother and father records.

mother records. The first record in the database always corresponds to the youngest person. All other records are linked in by their father and mother pointers. The source listing for the program appears next month in Part 3, written in MicroSoft Basic 5.21.

Figure 8(a) shows a small family tree. When programmed in Basic, all of the data at each node are placed in a single record. Each record contains pointers to the ancestor records. The family tree in 8(a) appears as a data file in 8(b). Part 3 provides additional information on representing tree structures in Basic.

Summary

By viewing the memory of a computer as an organized collection of data, rather than mere bits and bytes, simple and complex data structures are created. Many problems can not be solved unless the proper representation for the data is used.

Lists are structures that grow and contract dynamically, and provide for rapid insertion, deletion, and rearranging of the list elements. The self-organizing list is only one example of how a list might be used. In fact, the entire programming language Lisp is based on the use of list structures.

Stacks are necessary for subroutine calls and provide a direct method of evaluating RPN expressions or converting algebraic notation into RPN notation. Several computer systems have been built based on *stack architectures*. Among these are the Burroughs B5500 and the UCSD P-Machine, simulated on the UCSD Pascal System. In addition, the computer language Forth uses a stack and an RPN-like notation for all of its operations.

Binary trees and other tree structures are especially important in database systems and file systems. They are often used to show relationships among members of a group (a family tree) and to organize data alphabetically or in some other collating sequence. The binary search algorithms have the interesting side effect of sorting their input into alphabetical order, and are sometimes used for the "Insertion Sorts," which will be described in Part 4.

Part 3 shows how these structures can be programmed in the Basic language and includes the source listing for the genealogical relationships program. Part 4 describes several sorting techniques, including Shellsort and Quicksort. Quicksort is an especially fast sort algorithm, well suited to sorting large tables of randomly distributed data. ☐

ARTWORX SCORES ANOTHER TECHNICAL KNOCKOUT.

Scene from GOLDEN GLOVES

HODGE PODGE: by Marsha Meredith

(Atari and Apple)

NOW AVAILABLE FOR ATARI!!! This captivating program is a marvelous learning device for children from 18 months to 6 years. HODGE PODGE consists of many cartoons, animation and songs which appear when any key on the computer is depressed. A must for any family containing young children.

PRICE \$19.95 diskette

□ **PM EDITOR:** by Dennis Zander (Atari, 16K)

Create your own fast action graphics game for the Atari 400 or 800 using its player missile graphics features. By using player data stored as strings, players can be moved or changed (for animation) at machine language speed. All this is done with string variables (PO\$(Y)=SHIP4). This program is designed to permit creation of up to 4 players on the screen, store them as string data and then immediately try them out in the demo game included in the program. Instructions for use in your own game are included. PM EDITOR was used to create the animated characters in ARTWORX RINGS OF THE EMPIRE and ENCOUNTER AT QUESTAR IV.

PRICE \$29.95 cassette \$33.95 diskette

□ **ROCKET RAIDERS** by Richard Petersen (Atari 24K)

Defend your asteroid base against pulsar bombs, rockets, lasers, and the dreaded "stealth saucer" as aliens attempt to penetrate your protective force field. Precise target sighting allows you to fire at the enemy using magnetic impulse missiles to help protect your colony and its vital structures.

PRICE \$19.95 cassette \$23.95 diskette

□ **FOREST FIRE TWO:** by Richard Petersen (Atari 24K)

FOREST FIRE has been enhanced and now offers a two player mode for head to head competition to see who can survive, suffer the least damage and put their fire out first. User input now determines landscape, wind and weather conditions, offering limitless game variation. FOREST FIRE's excellent color graphics have been made even better, turning your computer into a super-detailed fire scanner.

PRICE \$16.95 cassette \$20.95 diskette

□ **FORM LETTER SYSTEM:** (Atari, North Star and Apple)

This is the ideal program for creating personalized form letters. FLS employs a simple-to-use text editor for producing fully justified letters. Addresses are stored in a separate file and are automatically inserted into your form letter along with a personalized salutation. Both letter files and address files are compatible with ARTWORX MAIL LIST 3.0 and TEXT EDITOR programs.

PRICE \$39.95 diskette

□ **THE PREDICTOR** by Thomas Barker

(Apple, Atari, TRS-80, North Star and CP/M (M-BASIC)) This is a complete package that covers least squares fitting of parameters for two or more variables. THE PREDICTOR can be used for predicting sales and process behavior, trend analysis, model building and many other uses calling for multilinear regression techniques. Each option in the program is prompted with simple YES/NO commands making it very easy to use.

PRICE \$29.95 diskette

□ **PILOT:** by Michael Piro (Atari, 16K)

Pilot your small airplane to a successful landing using both joysticks to control throttle and attack angle. PILOT produces a true perspective rendition of the runway, which is constantly changing. Select from two levels of pilot proficiency.

PRICE \$16.95 cassette \$20.95 diskette

□ **TEXT EDITOR:** (Atari and North Star)

This program is very "user friendly" yet employs all essential features needed for serious text editing with minimal memory requirements. Features include common sense operation, two different justification techniques, automatic line centering and straightforward text merging and manipulation. TEXT EDITOR files are compatible with ARTWORX FORM LETTER SYSTEM.

PRICE \$39.95 diskette

□ **MAIL LIST 3.0:** (Atari, Apple and North Star)

The very popular MAIL LIST 2.2 has now been upgraded. Version 3.0 offers enhanced editing capabilities to complement the many other features which have made this program so popular. MAIL LIST is unique in its ability to store a maximum number of addresses on one diskette (typically between 1200 and 2500 names!). Entries can be retrieved by name, keyword(s) or by zip codes. They can be written to a printer or to another file for complete file management. The program produces 1, 2 or 3-up address labels and will sort by zip code (5 or 9 digits) or alphabetically (by last name). Files are easily merged and MAIL LIST will even find and delete duplicate entries! The address files created with MAIL LIST are completely compatible with ARTWORX FORM LETTER SYSTEM.

PRICE \$49.95 diskette

□ **THE VAULTS OF ZURICH:** by Felix and Greg Herlihy

(Atari, 24K, PET)

Zurich is the banking capital of the world. The rich and powerful deposit their wealth in its famed impregnable vaults. But you, as a master thief, have dared to undertake the boldest heist of the century. You will journey down a maze of corridors and vaults, eluding the most sophisticated security system in the world. Your goal is to reach the Chairman's Chamber to steal the most treasured possession of all: THE OPEC OIL DEEDS!

PRICE \$21.95 cassette \$25.95 diskette

□ **BRIDGE 2.0** by Arthur Walsh (Atari (24K), Apple

TRS-80, PET, North Star and CP/M (MBASIC) systems)

Rated #1 by Creative Computing, BRIDGE 2.0 is the only program that allows you to both bid for the contract and play out the hand (on defense or offense!). Interesting hands may be replayed using the "duplicate" bridge feature. This is certainly an ideal way to finally learn to play bridge or to get into a game when no other (human) players are available.

PRICE \$17.95 cassette \$21.95 diskette

□ **ENCOUNTER AT QUESTAR IV:** by Douglas McFarland

(Atari, 24K)

As helmsman of Rikar starship, you must defend Questar Sector IV from the dreaded Zentarians. Using your plasma beam, hyperspace engines and wits to avoid Zentarian mines and death phasers, you struggle to stay alive. This BASIC/Assembly level program has super sound, full player missile graphics and real time action.

PRICE \$21.95 cassette \$25.95 diskette

NEW PROGRAMS!

GOLDEN GLOVES: by Douglas Evans (Atari 24K)

Use your joystick to jab, block and duck as each player attempts to land the knockout punch. This unique real-time program brings all of the excitement of ringside to your Atari. GOLDEN GLOVES is a one or two-player game, or you can be a spectator as the computer controls both fighters.

PRICE \$22.95 cassette \$26.95 diskette

CRAZITACK: by Peter Adams (Atari 16K)

The Crazyies are attacking us and the only defenses are three MX bases. Missiles can be launched singly or in a salvo, but it is doomsday when you run out of missiles.

PRICE \$17.95 cassette \$21.95 diskette

DOMINATION: by Alan Newman (Atari 24K)

Between one and six players compete for power via economic, diplomatic and military means in this award-winning game. You must make decisions quickly, exercise skillful hand-eye coordination, out-guess your opponents and cope with random events.

PRICE \$17.95 cassette \$21.95 diskette

POKER TOURNEY: by Edward Grau

(Atari 32K, Northstar)

You are entered in a high stakes Draw Poker Tournament facing six opponents including Lake-wood Louie, Shifty Pete and Dapper Dan. Each has his own style of play and of bluffing. POKER TOURNEY utilizes the Joker, has true tablestakes play and each hand is played based on pot odds. The Atari version's graphics and sound are superb of course (programmed by Jerry White) making POKER TOURNEY the class program of its type.

PRICE \$18.95 cassette \$22.95 diskette

HAZARD RUN: by Dennis Zander (Atari, 16K)

The sheriff has spotted you and you must make the treacherous run through Crooked Canyon past Bryan's Pond to the jump at Hazard Creek and safety. You can even put the joystick-controlled GEE LEE car up on two wheels to make it through some tight spots. A lead foot is not always the answer as you dodge trees, rocks and chickens in this nerve-racking game. HAZARD RUN employs full use of player/missile graphics, re-defined characters and fine scrolling techniques to provide loads of fast action and visual excitement.

PRICE \$27.95 cassette \$31.95 diskette

Pilot-to-Basic Translator

M.R. Smith

In the development of courseware, the instructor really only needs to do three things: type a message to a student, receive the student's answer to check whether it is right, and jump to different parts of the lesson depending on whether the student's response was what was expected.

More complicated things are needed only about 5% of the time. Authoring languages, of which Pilot is an example, are designed to allow the instructor to develop courseware without bothering with the "computational details."

This article is divided into three parts. Part 1 details the Pilot commands and provides examples. Part 2 gives a description of how each Pilot command is turned into the equivalent Basic commands. Modifications can be made to adjust the Pilot commands to the needs of each courseware writer if that is desired. Suggested improvements and extensions are given. Part 3 describes how to choose a suitable text editor.

The program described here is designed to take care of those computational details. It takes a series of Pilot commands and turns them into a valid Basic program. Although the Basic programs that it writes are not tremendous, they perform the function of allowing the courseware to be effectively and simply made. If the writer of the courseware wants to take the Basic programs generated by this translator and do a little pruning, then he is welcome to do so and is able to do so very easily.

For this program to operate, it is necessary for the Pilot lesson to be on a disk TEXT file PILOT.LESSON NAME. This program takes each Pilot command and generates the equivalent series of Basic statements stored in a program called LESSON NAME where LESSON NAME is any lesson name.

When you are typing in this program be very careful of the syntax. The mixture of valid Basic statements inside apparently invalid PRINT statements can lead to reading and typing errors.

Pilot Commands

This section is rather terse. It is intended to show the simple richness of the Pilot language rather than give great detail on how to use the language. The tutorials that follow will perform that function.

M.R. Smith, 304, 86th Ave., SE, Calgary, Alberta, Canada T2H 1N7.

T: Type a line.

TC: Clear the page before typing.

TV: Vertical tab down a page. TV:5 would start at the fifth line.

TI: Type this line in inverse characters.

TH: Type this line and don't add a carriage return.

A: Accept a student answer.

M: Match the student's last response. M: A,B would compare student answer with A and B as letters or match against some known value. M:\$N1\$ would compare the student's last answer against what is stored in \$N1\$.

Y and N modifiers are used to perform an instruction depending on whether the last month instruction (M:) was true or not. For example, TN: Type this line if the last match was not true or MY: SECOND-ITEM try a second match if the last one was true.

* is used to start a lesson part.

E is used to finish the lesson. For example:

*:lesson 1

T:line 1 lesson 1

*:lesson 2

T:line 1 lesson 2

E:end of the lessons

U: is used to jump to a USER routine. The USER routine should start after the end of the main lesson. On completing the user routine, the program returns to the lesson part from which it came. Each user routine must end with the E: command so that it can be identified. For example:

*:main lesson

T:line 1

U:USER

T:line 1 of next bit of main lesson

U:USER

T:etc

.....

E:End of main lesson

*:USER

TH:Press return to continue

A:

E:

J: or jump command can be used to move different parts of a lesson. You may jump to a lesson part or to a label. The labels are local, meaning that they are valid only between two

....

J:START

L: is a link instruction which causes the running of another Basic program.

B: is any valid Basic instruction. (B: SPEED=120)

X: Checks whether this statement is true (Boolean algebra). Acts as a match instruction with more power. Sets the Y and N modifiers. (X: T < 3).

R: is a remark statement. It is used to place a remark or comment statement in the program (R:This is a remark).

G: is a graphics command. The graphics screen is divided into a grid 100 units long by 100 units wide. The bottom left-hand corner is the starting point (0,0).

GC: Clears the graphics screen.

GL: Draws a line.

GO: Turns on the graphics mode.

GP: Plots a point.

Program Description

This part of the article is for those experts who know they can improve upon my code. For people just interested in using Pilot, the only advantage of reading it is to get some idea of the limitations of this version of Pilot.

Each Pilot instruction is converted into its Basic equivalent and stored as a TEXT file on the disk. In Applesoft it is possible to EXEC this file straight into memory. EXECing a file means using a TEXT file as a series of commands as though you were typing the commands directly on the keyboard.

The translator beeps twice when it finds an error. Since a text file is being written to the disk, it is not possible to get a beep by typing PRINT CHR\$(7) as this would get into the file. Instead, a standard Apple machine language call (CALL -1059) is used.

The start of a program (*:command) establishes a REM statement and a jump from the current line number to line number +20. The ten lines after the REM statement are used for GOTOs to the line number of a label. For example the following sequence of statements would produce the following Basic

```
*:start      1000 GOTO 1020 : REM START
J:1          1020 GOTO 1001
J:5          1030 GOTO 1005
1T:          1040 PRINT
              1001 GOTO 1040
E:           1050 STOP
              1005 STOP: REM NO LABEL 5
```

The E: statement is used to tidy up and check for undefined labels. The next lesson start (*:) has the same effect. The very final E: statement of a program checks to see if any jumps to procedures have not been defined. For example

```
*:START      1000 GOTO 1020 : REM START
U:USER
T:TYPE       1030 PRINT
U:ANOTHER
E:           1050 STOP
*:USER       3000 GOTO 3020
T:           3020 PRINT
E:           3030 RETURN
              1020 GOSUB 3000
              1040 STOP : REM NO PROCEDURE U:
              ANOTHER
```

All errors in syntax are turned into statements starting in a STOP. This has the advantage that the writer can go in and make a modification to that statement without having to recompile the whole Pilot program.

The modify commands Y and N generate rather poor code but it works. The match instruction sets a FLAG that is checked for a 1 or a 0.

```
TY:PRINT     1000 IF FLAG THEN 1010
              1010 PRINT
              1001 GOTO 1020
TN:PRINT     1020 IF NOT FLAG THEN 1030
              1030 PRINT
              1021 GOTO 1040
```

The accept instruction is implemented by a subroutine starting at line 70 of the generated Basic program. The student's answer is stored in a variable ANS\$. The input routine is user-friendly. Backspaces and line delete (control-x) are supported.

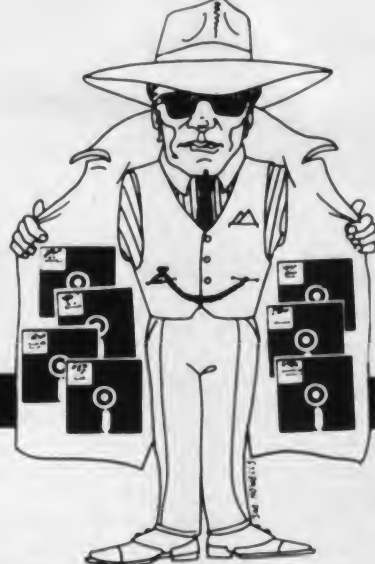

```
A:           1000 PRINT BELL$;; GOSUB 70
A: $N1$      1010 PRINT BELL$;; GOSUB 70 :
              NAME$ = ANS$
```

The match instruction is implemented by a subroutine starting at line 10 in the generated Basic program. The value to be checked is stored in a variable called CHECK\$ and then compared to the answer stored in ANS\$.

```
M:A          1000 FLAG = 0
              1010 CHECK$ = "A" : GOSUB 10 :
              IF FLAG = 1 THEN 1020
M:A,B,$N1$   1020 FLAG = 0
              1030 CHECK$ = "A" : GOSUB 10 :
              IF FLAG = 1 THEN 1060
              1040 CHECK$ = "B" : GOSUB 10 :
              IF FLAG = 1 THEN 1060
              1050 CHECK$ = N1$ : GOSUB 10 :
              IF FLAG = 1 THEN 1060
```

CIRCLE 212 ON READER SERVICE CARD

Pilot-To-Basic, continued...

The Boolean check (X: instruction) is turned into a Basic statement that sets the FLAG

```
X:T < 3
1000 IF (T < 3) THEN FLAG = 1
```

The other commands are implemented in a straightforward manner.

Subroutine Location

- 20 Get a file name.
- 140 Load the statements needed to initialize the Basic program being generated.
- 170 Generate the Basic program.
- 200 Clear up any undefined labels or lesson part names.
- 430 Make and execute the EXEC file.
- 1000 Find out which Pilot command is to be evaluated.
- 1070 Check on labels and the presence of a colon.
- 1170 Check if need to use the Y and N modifiers.
- 1260 Turn the Pilot command into a Basic statement.
- 24040 Performs the conversion of the accept (A:) command.
- 21010 Performs the conversion of the Basic (B:) command. Any apostrophes become quotation marks. For example B:PRINT 'PRINT THIS LINE' becomes 1000 PRINT "PRINT THIS LINE". This is a useful function if trying to get a \$ printed. The presence of a \$ in a type (T:) statement is assumed to be the start of a variable name.
- 20160 Converts the end (E:) command and clears up any undefined labels.
- 40010 Converts the graphics (G:) command. If this is the first graphics call then a HGR (call high res graphics) is performed.
- 29010 Converts the jump (J:) command. If the lesson name has not yet been used (i.e. not defined) the name is stored in NEED\$(NEED,0) and the line number at which it is required is stored in NEED\$(NEED,1).
- 23010 Converts the link (L:) instruction.
- 25010 Converts the match (M:) instruction.
- 20510 Converts the remark (R:) instruction.
- 35010 Converts the sound (S:) instruction. If this is the first sound instruction in the program, then the machine language subroutine needed to generate the sounds is loaded into the Basic program being made.
- 26000 Converts the type (T:) instruction. I have found that on a 40-character screen, it makes easier reading if every line of text is separated by a blank line. This is achieved by
 - T: line one
 - T:
 - T: line twoYou might find it more convenient to automatically supply a blank line after each Type instruction. To do this change line 26210 to
26210 PRINT "": PRINT "
- 27010 Converts the user (U:) instruction. If the procedure being called is not found, then its name is stored in NEED\$(NEED, 0) and the negative of the line number where it is needed is stored in NEED\$(NEED,1). By storing the negative of the line number, it is possible for the routine at line 200 to decide whether it is clearing up a jump or a user instruction.
- 22010 Converts the Boolean (X:) instruction.
- 30010 Converts the lesson part (*) instruction. This clears up any undefined labels if that has not already been done by a preceding E: instruction. Lesson part names are stored in NP\$(J,0) and the line numbers at which they start in NP\$(J,1).
- 50000 This performs the loading of the match and accept subroutines into the Basic program being generated.

60000 Performs the initialization and description of the variables used in the program.

Suggested Extensions to Pilot

A link and chain instruction would be useful to allow the passing of variables, such as a student's name or number of questions correct, between programs. However, the problem of initializing the new program must be solved. A routine must recognize whether a program has been chained or called straight into memory, and adjust the initialization accordingly.

The code here for multiple matches works but could be made more elegant.

At the moment the Y and N must come second in a command or they are not implemented. This means that the command TYI: is compiled correctly, but "type this line in inverse if last match was true," is treated the same as TI:.

Syntax checking for the correct number of dollar signs in the match and type commands could be made more fool proof. At the moment no effort is made to see if the variable name is a valid one. For example, \$LONG\$ would generate a RUN-time error because of the presence of the ON in the middle of LONG.

When a Pilot statement is found with syntax errors, e.g. missing labels, a REM statement is formed, preceded by a STOP. It might be convenient to put the REM statement in inverse print to enable it to be spotted more easily.

Choosing a Text Editor

The presence of the colon in the middle of each Pilot command creates problems. Check your editor to see if it will work. The Apple DOS-Toolkit recognizes the colon as a command and will not let you enter it into a file. Other editors will let you enter it into a file but the Pilot-to-Basic program may not read it in properly. It expects all lines in a file to be stored as "LINE," i.e. a line surrounded by quotes. This means the line can be read in by an INPUT statement, giving slightly faster disk access than a GET statement.

If you find that your editor will read and reload files satisfactorily but Pilot-to-Basic will not read them, make the following modifications.

Replace line 1030 with:

```
1030 SENT$ = ""
1032 GET A1$ : IF A1$ = CHR$(13) THEN 1036
1034 SENT$ = SENT$ + A1$ : GOTO 1032
1036 IF PFLAG = 0 THEN PRINT D$;"WRITE "ENAME$
```

The text editor which I will describe in a forthcoming issue of *Creative Computing* does not need this modification. In addition, the text editor checks each statement as it is entered to check that it starts with a valid Pilot command. This removes many simple syntax errors at a time when they are easy to change. In addition, it converts all quotation marks to apostrophes, which removes another potential problem.

If you would like an AppleSoft disk containing this program, a copy of the editor and a series of Pilot tutorial lessons, send a stamped addressed envelope, containing a 5" disk labelled with your name and address together with sufficient padding to protect the disk. Please enclose an additional \$5 to cover my time and the wear and tear on my disk drives. To quote Chuck Carpenter, "If you don't send the stamped addressed envelope and the money, then I'll hang onto your disk until you do." If you live outside Canada, please enclose the money equivalent of the postage as the Post Office will not accept foreign postage. (\$2.50 for a disk plus packing going First Class to the U.S.) □

INTRUDER!

Four nuclear reactors have gone out of control, ready to melt down in only minutes. They are also protected by pre-programmed robots that can destroy anything in seconds. Your mission is to shut down the reactors and capture the robots before a melt down occurs. But before you enter... remember you are the

INTRUDER!

MATH PACK + - ÷ ×

Atari brought the computer age home. Now we bring home the educational software.

MATH PACK was written for the educational side of the Atari by professional educators in the field of mathematics. All four independent math programs use Atari's sound and graphics to make learning more fun and enjoyable for your whole family. A final summary at the end of the programs lets you see how well you've done or what area needs to be practiced. Age and skill levels

- 1) Math Pack Drill
- 2) Equations
- 3) Jumble
- 4) Digit Span

*BASIC and **Joysticks required.

Computer Program Books for Beginners

Everything you need to know to get started programming your own computer. These handy books of programs, each jam-packed with easy-to-understand info for beginners, are crammed with hundreds of tips, tricks, secrets, hints, shortcuts, techniques, plus hundreds of ready-to-run programs.

APPLE Computer

101 APPLE Computer Programming Tips & Tricks, secrets, hints, shortcuts, techniques, for APPLE II, 128 pages \$8.95

33 New APPLE Computer Programs for Home, School & Office, practical ready-to-run software for APPLE II, 96 pages \$8.95

APPLE Computer BASIC Coding Form, handy preprinted program worksheets make writing software easy, fun, 40-sheet pad \$2.95

Color Computer

101 Color Computer Programming Tips & Tricks, learn-by-doing instructions, hints, secrets, shortcuts, techniques, insights, for TRS-80 Color Computer, 128 pages \$7.95

55 Color Computer Programs for Home, School & Office, practical ready-to-run software with colorful graphics for TRS-80 Color Computer, 128 pages \$9.95

55 MORE Color Computer Programs for Home, School & Office, sourcebook of useful type-in-and-run software with exciting graphics, for TRS-80 Color Computer, 112 pages \$9.95

The Color Computer Songbook, 40 favorite pop, classical, folk & seasonal songs arranged for TRS-80 Color Computer, ready-to-run music programs, 96 pages \$7.95

Color Computer Graphics, complete guidebook loaded with tips, tricks, hints, secrets for making the most of TRS-80 Color Computer video graphics. Learn-by-doing instructions plus complete programs, 128 pages \$9.95

My Buttons Are Blue and Other Love Poems from the Digital Heart of An Electronic Computer, for computer lovers \$4.95

Color Computer Coding Form, handy preprinted programming worksheets make writing software easy, fun, 40-sheet pad \$2.95

Pocket Computer

Pocket Computer Programming Made Easy, new fast & easy way to learn BASIC, make your computer work for you, for TRS-80, Sharp, Casio pocket computers, 128 pages \$8.95

101 Pocket Computer Programming Tips & Tricks, secrets, hints, shortcuts, techniques from a master programmer, 128 pages \$7.95

50 Programs in BASIC for Home, School & Office, sourcebook of tested ready-to-type-in-and-run software for TRS-80 and Sharp pocket computers, 96 pages \$9.95

50 MORE Programs in BASIC for Home, School & Office, ideal source for lots more useful software for TRS-80 and Sharp pocket computers, 96 pages \$9.95

Murder in The Mansion and Other Computer Adventures, with 24 game programs, murder mystery, space, adventure, loads of fun for TRS-80 and Sharp pocket computers, 96 pages \$6.95

35 Practical Programs for the Casio Pocket Computer, book of useful type-in-and-run software for the FX-702P, 96 pages \$8.95

Pocket-BASIC Coding Form, preprinted program worksheets make writing programs a breeze, for TRS-80, Sharp, Casio pocket computers, 40-sheet pad \$2.95

Universal BASIC Coding Form, 40-sheet pad \$2.95

IBM Personal Computer Form \$2.95

NATIONALLY PROMINENT PR MAN
GIVES IT TO YOU STRAIGHT IN

HOW TO STEAL A MILLION

IN FREE PUBLICITY

By Harry Barber

how and where to get all the free
publicity you'll ever want

This remarkable book shows you...

- How to professionally prepare news releases and articles so they will be accepted by the media.
- How to develop your mailing lists.
- How to work with the news media.
- How to measure the effectiveness of your publicity
- Dozens of ways to secure additional publicity at nominal cost.
- Over 600 outlets for free publicity and reference to thousands of additional sources.

In this comprehensive publicity guide, Harry Barber eliminates the mystique of "free publicity"—shows you in detailed, step-by-step procedures, how and where to get it—all the free publicity you'll ever want for yourself or your organization.

How To Steal A Million \$ In Free Publicity is the ideal reference guide for business owners, corporate executives, political groups, non-profit organizations, and individuals in all walks of life.

About the author—

Nationally prominent advertising and public relations executive, Harry Barber, gives it to you straight in his latest book.

The author has developed hundreds of publicity campaigns in conjunction with screen and television personalities, US Astronauts, USAC Racing, major corporations, and private individuals.

NO WAITING

Now, with Microfazer you can compute while you print.

Time is money. You own a computer system because you know that it can save you money by simplifying office procedures and reducing the time involved in payrolls, accounting, word processing and those other wonderful things we all must do. Time is an important resource which should not be wasted. Even though your system seems efficient, you could be wasting valuable time if you ever wait for your printer to finish printing before more information can be entered into your computer.

NO WAITING. Now with Microfazer by Quadram there will be no more waiting.

The Microfazer is an inexpensive universal printer/buffer that can be used with all popular micro-computers and parallel printers. Microfazer receives information from the

computer at up to 4000 characters per second (your computer thinks the printer is printing this fast), holds it until your printer can handle it, and then sends it on to the printer. Controlled by a custom LSI, Microfazer uses standard centronics signals and is powered by the printer or an inexpensive external AC adapter. Buffering of 8K, 16K, 32K or 64K is available.

EASY INSTALLATION. The Microfazer is in a small case (3.5" x 7" x 1"). It is engineered to be plugged directly into the input port of the Epson and other similar printers. Installation can be completed in less than 60 seconds. How's that for not wasting time! Most other centronics compatible printers can be attached by using an adapter cable.

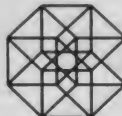

FLEXIBLE. If you should purchase a faster printer later, just unplug and add to your new printer. Changing Computers? Microfazer is not computer dependent. Want to add more buffer? No problem. Microfazer is

user-expandable up to 64K. No other buffers come close in flexibility.

LOW PRICE. Only \$159 for 8K buffer, \$199 (16K), \$225 (32K) and \$299 for full 64K. Serial-to-Parallel and Serial-to-Serial versions are available at slightly higher prices.

QUADRAM QUALITY. The Microfazer was designed with performance and reliability in mind. With a one year warranty, you get Quadram Quality at a surprisingly low price.

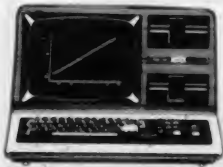

ASK YOUR DEALER. If you are currently wasting time waiting on your printer, see your local personal computer dealer. If your dealer is not currently stocking Quadram products, have them call us at (404) 923-6666.

Power input through SYSTEM SAVER. Line surge suppression protects programs and data by smoothing out dangerous power surges and spikes.

SYSTEM SAVER contains two switched power outlets. You can control your printer and monitor from the front mounted switch.

SYSTEM SAVER provides correct cooling. Fresh air is drawn across the mother board, over the power supply and out the ventilation slots.

Convenient front mounted heavy-duty power switch with pilot light. Switch controls SYSTEM SAVER, Apple II, and both rear outlets.

Demonstrating the Gas Laws

David A. Holko

Gas laws frequently present problems for students studying General Chemistry. One reason for the difficulty is the student's inexperience in working with gases in a laboratory.

The concepts involving an ideal gas confined to a container where pressure on the gas, temperature of the gas, or number of moles of gas can be controlled remain nebulous even when examples of tire pumps, aerosol cans, balloons or lab bottles are explained.

This program, when used as a student activity, attempts to demonstrate the relationship between volume and pressure for Boyle's Law, volume and temperature for Charles's Law, or volume and moles of gas for Avagadro's Law.

Initially, the student selects the law which is to be demonstrated. The video monitor shows a simple cylinder, and positions the piston, which traps a volume of gas and is ready to respond to changes in temperature, pressure, or moles of gas confined respective of the law chosen.

When an increase or decrease is entered, the piston moves, correspondingly, showing the effect on the volume of confined gas. The changes are calculated using the ideal gas law $V = nRT/P$ where V is volume, n is the number of moles of gas, R the universal gas constant, T the temperature and P the pressure.

If the student graphs the computer calculated values, checks the values by

doing hand calculations, or closely analyzes the values calculated by the computer, the relationship of molar gas volume at Standard Temperature and Pressure may become obvious.

The advanced student, via graphing and analysis, can be led to determine the actual value of R , the Universal Gas constant, by using the computer simulation as an experimental apparatus.

There is a minimum volume the cylinder will hold. This design was effected to allow graphic extrapolation of the data to determine the value of Absolute Zero with Charles's Law.

The programming is simple and short, written to aid and reinforce the student's application of the gas laws and equate a simulated moving piston to theoretical values derived using the ideal gas law. □

Animath

Jerry Wright and Lloyd Ollman, Jr.

The graphics potential of the Atari personal computer is a powerful educational tool. It can be used to transform the chores of learning into the fun of learning.

A growing number of companies now produce educational software for the Atari computer, but the quality of this software varies widely. A good children's educational program draws children to play with it, and allows learning to happen along with the fun.

When you think back to your school days (assuming you're not still there), what did you find to be the worst part of the learning process? For us it was drill and practice. Here's a children's educational program that makes addition practice enjoyable using an interesting type of animation.

The program is called Animath, for animated math program, and it uses a modified character set to create a sauntering gorilla. Player/missile graphics are also used to spice up the game.

There are several commercial programs which can be used to create modified character sets. Perhaps the best-known of these is *Fontedit*, from Iridis #2. We used a program similar to this to write a "gorilla" font to disk. The original version of this program called the font from disk

and loaded it into memory. The Atari character set is a part of ROM, so the font must be moved to RAM, where it can be modified by the appropriate POKes into memory.

We knew that many Atari owners utilize cassette storage, so we wrote a little utility to save the font as data statements at the end of the program. There are 24 modified characters, represented as 24 data statements. Because the characters are set up in 8 x 8 blocks, each of the eight numbers in the individual data statements is one 8-bit word, or byte.

After the gorilla is POKed into RAM, he can be animated by the POSITION command. By changing the positions of his arms and legs, we simulate motion, and the gorilla is able to run down the screen to the first problem.

Thanks to Basic A+ from Optimized Systems Software, we were able to get an accurate list of variables. The first list we generated contained several variables we couldn't find. After listing the program to disk and entering it back in the computer, we came up with an accurate variable table, without all the variables that had been eliminated in earlier incarnations of the program. It's always wise to LIST, then ENTER programs when they are finished, to clear the Atari variable table of all but the variables actually being used.

Variable Table

NUS—String holding answer input by player
 TNS—String holding randomly generated top number
 BNS—String holding randomly generated bottom number
 AS—String to hold player input to questions
 P—Horizontal position of individual number input by player as an answer
 START—Beginning location of character set in the operating system
 NOW—Variable loop pointing to next character in the character set
 CH—ATASCII number of character set
 Q—Location of RAMTOP (PEEK (106))
 I—Location of PLAYER/MISSILE Base Address
 T—Variable for top end of volume in motion sounds
 L—Number of problems completed
 X—Horizontal position variable
 WAL—Gorilla movement subroutine
 PR—Number of problems chosen
 W—Number of problems successfully completed
 TN—Actual top number of problem
 BN—Actual bottom number of problem
 D—Decreasing pitch used in booming sound
 E—Timing loop variable
 A—Vertical position of gorilla or erase pattern
 K—ATASCII number input from keyboard
 N—Actual number input from keyboard
 AMT—Answer: total of answer numbers in the ones, tens, and hundreds columns
 J—Sum of top number (TN) and bottom number (BN)

Jerry Wright, 18812 116 Ave. SE, Renton, WA 98055.

THE NORMAL EXPECTATIONS OF SMALL BUSINESS

All too often our normal expectations for small business financial reporting are "logically abnormal". We limit our financial reporting activity to satisfying the needs of the IRS. Kept hidden in most financials is valuable information waiting to be found to assist us in managing our business more profitably. Our normal expectations dictate that the cost and difficulty of organizing and reporting such valuable information will prevent its access.

Likewise, most general ledger systems for the Apple II invariably restrict themselves to assisting us in satisfying the IRS . . . and not much more.

ACU=LEDGER, a newly introduced Financial Management System, represents a **dramatic departure from the "norm"**.

ACU=LEDGER simultaneously addresses:

- = General Ledger Requirements (IRS, etc.)
- = Product Profitability Analysis (Job Cost)
(with automatic proration of 'overhead burden')
- = Financial Budgeting, Forecasting, and Modeling
- = Automatic Depreciation Scheduling/Posting (including A.C.R.S.)
- = Instantaneous, upon demand (on line) inquiry
- = Two Accounting Months "open" simultaneously
- = Full Year's detail entries retained on the current file

Moreover, **ACU=LEDGER** allows you to describe **your vision of your environment** (emphasizing Marketing, Operations, both, etc.). You can even describe your environment emphasizing one aspect, periodically re-organize to emphasize another, produce the management reports, and switch back to the original 'profile' — or stay with the new!

All of this is done within an integrated, logical universe (no costly redundant input for "Budget vs. Actual" Reporting, etc.). In fact, your bookkeepers' skills will improve because they use **ACU=LEDGER** (many bookkeepers' present difficulties are directly traceable to a problem in finding the "logical thread" that holds the current system together).

ACU=LEDGER's logical structure is easily matched by its technical sophistication, viz.:

- = Produces many times more reports than competitive systems (up to 289 unique P&L's, daily if you choose)
- = Stores many times more entries than any competitive system
- = Has multiple techniques for most functions (may use any or all of 4 methods to post entries)
- = Extremely efficient — One test "closed" one day's 3,440 "entry-sides" in 2½ minutes!

ACU=LEDGER is so versatile that it can be operated in a very restrictive manner (minimal skill level); or it can be operated utilizing all of its advanced features (or anywhere in between). Migration from one level to another can be effected as you become familiar with **ACU=LEDGER**; and comfort can be taken in the recognition that as your needs change, **ACU=LEDGER** can change with you.

ACU=LEDGER™

ACU=LEDGER™

Animath, continued...

C—Number of times gorilla goes through movement routine

B—Volume of motion sound routine ending in variable T, also wait routine

F—Flag set to 0: input character set. Flag set to 1: jump directly to main body of program

WT—Wait routine

The Program

Lines 0 through 4 introduce our authors, and set up our new character set. Line 2 DIMensions the various strings we will need, and makes sure that the string to hold the answer is empty.

In line 3 we find the top of our available memory by PEEKing RAMTOP, which is location (106) in memory. Then we fool the operating system into believing that the available memory is five pages smaller than it actually is, so we won't accidentally load our program on top of the changes we are going to make.

We then get an even number above our new RAMTOP (by adding 1) and multiply this number by 256. This new value of Q gives us the starting location of our new character set.

We use the number 256 because the Atari 6502 microprocessor divides memory into 256-byte "pages," and we must start the new character set at the beginning of an even page mark.

Line 4 begins the river sound and jumps to the introduction and instructions.

The subroutine at 6100 prints out the name of the program, and the authors. Then there is a pause at line 6120, so the title can be read, followed by a jump to the section asking for the number of problems desired—line 6000.

If this is the first time the program has been run, the F flag is set at 0 and a message asks the player to wait while the character set is set up. The program then returns to line 5.

The Atari character set can't actually be changed, because it is permanently embedded in ROM starting at address 57344. So we must move it into RAM. We do this in line 3 by PEEKing the character set and then POKEing it into the space we have set aside above RAMTOP.

Line 6 reads the DATA defining the new characters and POKEs it into our new locations. In line 11 we POKE the location of our new character set into location (756), just above RAMTOP in the Character Base Register.

There is a stream in our graphics jungle. In line 8 we create this by turning on two Players and setting their location just below RAMTOP then POKEing this into the Player/Missile Base address 52479.

Jumping to line 15, the horizontal position of Player 0 is POKEd into 53248, Player 1 into 53249. POKEs (704) and (705) set the color, POKEs (53261) and

NO TURTLE DRAWS THE BOTTOM LINE LIKE THE CyberLOGO TURTLE.

The CyberLOGO TURTLE is your budget-conscious LOGO choice. Designed for the classroom and home microcomputer user, the CyberLOGO TURTLE is an affordable open-ended, computer literacy learning environment. It runs on any Apple II, with only 48K! No language card required.

The CyberLOGO TURTLE also provides these special features:

- Turtle graphics include colored backgrounds and a variety of pen colors.
- Sound increases student interest and attention in the learning process.
- A filing system saves both pictures and programs.
- Local variables enable the student to count within a program while global variables permit the exchange of information among programs.
- A full-screen editor allows users to write, review, and change a program on the whole screen.

- On-line "HELP", a unique CyberLOGO TURTLE feature, provides a user-friendly menu that offers a series of answers to questions about using the system as well as examples of programming.

CyberLOGO counts when it comes to continued learning with another Cybertronics International, Inc., product, the highly acclaimed "Karel the Robot," a bridge from LOGO to Pascal.

The CyberLOGO TURTLE learning environment, for the classroom and the home, includes the TURTLE Disk and a user manual priced at a budget-conscious **\$99.95**.

To order the CyberLOGO TURTLE, send your check or money order to: Cybertronics International, Inc., 999 Mount Kemble Ave., Morristown, NJ, 07960.

For credit card orders, phone (212) 532-3089.

DATA PLOTTING SOFTWARE

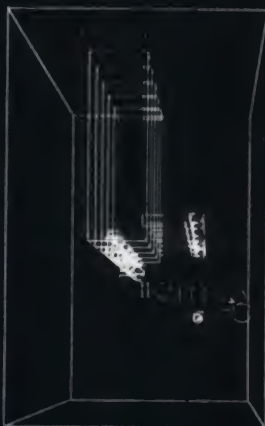

DATA PLOTTING ON MICROS — A collection of programs to process and display all types of data: bar charts, stock market charts, engineering and scientific data, 3D views of surfaces, pie charts, sorting, filtering, running averages, curve fitting, and more. Application to business, engineering and science. All program listings are in BASIC fully documented and keyed to theory. Use them as-is or modify for your own applications. This is one of the most complete collections of data plotting programs available anywhere — and the source code is fully documented!

Book — \$24.95, Disk — \$19.95

ENGINEERING SOFTWARE

ENGINEERING SOFTWARE FOR MICROS — A self-teaching guide to developing software for engineering applications of microcomputers. Emphasis is on combining graphics with engineering problem solving. Programs included to interactively create engineering drawings, store on disk file, recall, modify and merge. Other programs for simulation, mechanisms design, heat transfer, circuit analysis, optimizations and including Monte Carlo techniques. Programs for Fourier analysis display frequency spectra graphically. This is a valuable collection of modern engineering analysis software for students and professionals.

Book — \$28.50, Disk — \$19.95.

KERN PUBLICATIONS

190 Duck Hill Rd
Duxbury, MA 02332

GRAPHIC SOFTWARE

GRAPHIC SOFTWARE FOR MICROCOMPUTERS — This self-teaching guide will show you how to write your own graphics software. 61 programs for 2D and 3D graphics: interactive input, translations, rotation, isometric views, perspective, scaling, stretching, clipping, surface intersections, shading, hidden line removal, tablet software, animation and more. Applications to science, engineering and business. All programs in BASIC fully documented. Modify and combine to suit your own applications. "One of the most outstanding books on computer software" — *A Grund U Illinois*. "The best book available on microcomputer graphics" — *Creative Computing Feb. 1982*.
Book — \$21.95, Disk — \$18.95

STRUCTURAL ANALYSIS SOFTWARE

STRUCTURAL ANALYSIS ON MICROS — This self-teaching guide contains a series of programs which calculate stresses and deflections in beams, plates, trusses and frames using conventional and matrix techniques. Theory, equations and program listings fully documented. Written for the non-specialist who wants to use his micro for structural analysis with minimum investment in time. Use the programs as is or modify for your own applications.
Book — \$39.95, Disk — \$19.95

Books contain fully documented program listings in BASIC with theory and equations. **Disks** contain the same programs as the books but without documentation. When ordering disks, please specify APPLE II (48K, 128K, 256K) or IBM. To order, send check drawn on U.S. bank, money order in U.S. funds, Visa or Mastercard number with expiration date to: **KERN PUBLICATIONS**, 190 Duck Hill Road, P.O. 1029A, Duxbury, MA 02332. Add \$2 per book 4th cl postage in US and Canada. \$3.75 in US and Canada. \$4.50 in US and Canada. \$12 in Europe and Central America. \$18 elsewhere. Call (617) 934-0445 for faster delivery.

Animath, continued...

(53262) set up the shape and POKEs (53256) and (53257) set up Player size.

We keep track of the number of times the Gorilla finds a problem with the variable L, and use the variable X as the X coordinate of our gorilla's location. Atari Basic accepts names as well as line numbers in GOTOs and GOSUBs, so we give the movement subroutine a name, WAL.

Line 40 sets the starting location of the animal by using a position statement in X/Y coordinate form. Line 55 then randomly selects a top number which is placed in TN\$ and a bottom number, placed in BN\$.

Line 56 places the number of problems successfully answered next to the number of problems tried, and line 57 gets more numbers for the number strings. Line 58 gets the value of the strings and places them into variables TN and BN.

Line 60 places the numbers in their proper positions at the bottom of the screen.

In line 60 we jump to the gorilla animation section. This time WAL=500 so in line 500 we find the vertical positions for the gorilla in a FOR/NEXT loop and jump to the actual movement subroutine at line 2000.

Lines 2000 through 2009 draw the gorilla and move his arms and legs, while making the movement sound. Then the subroutine jumps back to line 501 where it gets a new position from the variable A in the FOR/NEXT loop. It then goes back to the movement routine until it reaches vertical position 17 on the screen. Next we jump back to line 100 for a sound routine and then jump to line 600.

This is the keyboard routine—where we PEEK location (764) to find the internal code of the last key pressed. The computer runs through a series of IF/THEN statements to determine which key has been pressed by the player, and compares it to a list of valid inputs. The first number input goes into the ones column, the second into the tens column, the third into the hundreds column, and the fourth into the thousands column.

This is done by setting up a number holding string (NU\$). The position of the number in the string is determined by line 700, which starts with P=4, so the first number is placed in the fourth position of NU\$, the second number in the third position and so on. Line 705 prints the NU\$ on the screen and then the Atari loops around to line 120 and back through the keyboard routine until Return is pressed at line 660.

Line 670 allows you to recover if a mistake is made. All you have to do is press Delete/Backspace or the Space Bar, the NU\$ is cleared, and you start back at the ones column. You then repeat the

CIRCLE 146 ON READER SERVICE CARD

Animath, continued...

procedure until you have what you feel is the correct answer.

Pressing Return takes you out of the loop at line 660 where this time the value of the numbers in NUS\$ is transferred to the variable AMT. We then jump to 800 to find out if the answer is correct.

Line 810 clears NUS\$ and resets location (764) by POKEing in 255.

Lines 820 and 830 blank out the standing gorilla, then 835 determines if the answer is right. If it is, the gorilla walking routine (WAL) jumps back to line 500, adds 1 to the amount answered correctly, and jumps to line 1000.

If AMT doesn't equal J, then the gorilla movement subroutine is set to 900, the horizontal position (X) is moved over 8 places, and the gorilla runs through the subroutine at line 400 which forces him into the river. A reverse FOR/NEXT loop carries him downstream in subroutine 3000. Then the program jumps back to line 55 where the new value of X swims him upstream with the subroutine at line 900, and gives him a new addition problem to answer.

If the question was answered correctly, the program jumps to the subroutine at 2000 through 2009, where the gorilla jumps up and down with joy. The routine then sets the sound volume variable T to 20 and the horizontal position variable X to 1 and then jumps back to the main program loop at line 55.

When the number of problems chosen (PR) equals the number actually done (L), the program goes to line 7000 where it displays a score and offers a chance to play again.

We hope this program and accompanying explanation have given you an idea of some of the things that can be achieved with the Atari Personal Computer. We enjoy this system thoroughly, and hope that many more people will soon see the Atari as a computer with truly incredible possibilities.

Instructions

After the program is loaded and the player has chosen the number of problems, the gorilla will come on the screen and run down to the first problem. The answer should be typed in with the first number in the ones column, the second in the tens column, and the third in the hundreds.

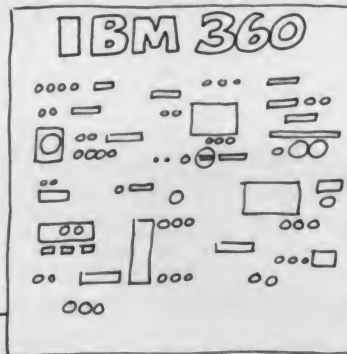

If you make a mistake, just press the space bar. When you have the correct answer, press the return key. The gorilla will tell you if you are right.

In the listing that follows, several characters are in square brackets. These should be typed in as inverse characters. The Epson MX-80 prints a "]" instead of a clear sign, so when you see that symbol type Escape, then Control and Clear together. □

A Mortgage Amortization Program for the Atari

Marijane Green

I wrote the following program for the Atari 400 or 800 while learning the ins and outs of Basic. It uses a standard banking

Marijane Green, 4801 N.E. 16 Ave., Ft. Lauderdale, FL 33334.

formula to compute the mortgage payment due when given the amount of the loan, interest rate and time period. It also displays the payment number, loan balance, amount of payment applied to the principle and the amount of interest charged that month.

In addition, the total annual interest is

displayed for each calendar year. If only the annual interest payments are wanted, the following changes will cause the printing of the monthly figures to be suppressed.

AMORTIZATION": ? #6;""

These instructions display a title on the screen.

The instructions on lines 20 to 36 merely tell the user what the program will do.

Enter loan amount in dollars.

Enter interest rate in %, i.e. 10,12.

Enter number of months.

Set up to accept a three-letter abbreviation for first month. See

DATA for spelling.

Enter year as 19xx. or 20xx.

X=number of months loan held in first year.

Abbreviation for month not correct.

See note at end.

Round payment to nearest cent and print.

Set headings.

Start loop. Get monthly interest (MI).

Round interest to nearest cent. Adjust values for display.

Display table. Adjust X. Get total interest to date for this year.

Time to print yearly interest.

Print interest for last year.
Reset.

NOTE: In line 110 the formula for computing the payment was taken from "How to Profit from Your Personal Computer" by T.G. Lewis, page 72. $\text{Payment} = (iVA)/(V-1)$ where i =monthly interest rate in fraction form: A=amount of loan; M=length of loan in months; V=amount of interest on \$1 when compounded by adding interest fees: $V=(i+1)^M$.

BUSINESS 100 PROGRAM LIST

NAME

DESCRIPTION

1 RULE78 Interest Apportionment by Rule of the 78's
2 ANNU1 Annuity computation program
3 DATE Time between dates
4 DAYYEAR Day of year a particular date falls on
5 LEASEINT Interest rate on lease
6 BREAKEVN Breakeven analysis
7 DEPRSL Straightline depreciation
8 DEPRSY Sum of the digits depreciation
9 DEPRDB Declining balance depreciation
10 DEPRDDB Double declining balance depreciation
11 TAXDEP Cash flow vs. depreciation tables
12 CHECK2 Prints NEBS checks along with daily register
13 CHECKBK1 Checkbook maintenance program
14 MORTGAGE/A Mortgage amortization table
15 MULTMON Computes time needed for money to double, triple, etc.
16 SALVAGE Determines salvage value of an investment
17 RRVARIN Rate of return on investment with variable inflows
18 RRCONST Rate of return on investment with constant inflows
19 EFFECT Effective interest rate of a loan
20 FVAL Future value of an investment (compound interest)
21 PVAL Present value of a future amount
22 LOANPAY Amount of payment on a loan
23 REGWITH Equal withdrawals from investment to leave 0 over
24 SIMPDISK Simple discount analysis
25 DATEVAL Equivalent & nonequivalent dated values for oblig.
26 ANNUDEF Present value of deferred annuities
27 MARKUP % Markup analysis for items
28 SINKFUND Sinking fund amortization program
29 BONDVAL Value of a bond
30 DEPLETE Depletion analysis
31 BLACKSH Black Scholes options analysis
32 STOCVAL1 Expected return on stock via discounts dividends
33 WARVAL Value of a warrant
34 BONDVAL2 Value of a bond
35 EPSEST Estimate of future earnings per share for company
36 BETAALPH Computes alpha and beta variables for stock
37 SHARPE1 Portfolio selection model-i.e. what stocks to hold
38 OPTWRITE Option writing computations
39 RTVAL Value of a right
40 EXPVAL Expected value analysis
41 BAYES Bayesian decisions
42 VALPRINF Value of perfect information
43 VALADINF Value of additional information
44 UTILITY Derives utility function
45 SIMPLEX Linear programming solution by simplex method
46 TRANS Transportation method for linear programming
47 EOQ Economic order quantity inventory model
48 QUEUE1 Single server queueing (waiting line) model
49 CVP Cost-volume-profit analysis
50 CONDPFOT Conditional profit tables
51 OPTLOSS Opportunity loss tables
52 FQOQOQ Fixed quantity economic order quantity model
53 FQEOQSH As above but with shortages permitted
54 FQEOQPB As above but with quantity price breaks
55 QJUEQCB Cost benefit waiting line analysis
56 NCFANAL Net cash flow analysis for simple investment
57 PROFIND Profitability index of a project
58 CAPI Cap. Asset Pr. Model analysis of project

59 WACC Weighted average cost of capital
60 COMBAL True rate on loan with compensating bal. required
61 DISCBAL True rate on discounted loan
62 MERGANAL Merger analysis computations
63 FINRAT Financial ratios for a firm
64 NPV Net present value of project
65 PRINDLAS Laspeyres price index
66 PRINDPA Paasche price index
67 SEASIND Constructs seasonal quantity indices for company
68 TIMETR Time series analysis linear trend
69 TIMEMOV Time series analysis moving average trend
70 FUPRINF Future price estimation with inflation
71 MAILPAC Mailing list system
72 LETWRT Letter writing system-links with MAILPAC
73 SORT3 Sorts list of names
74 LABEL1 Shipping label maker
75 LABEL2 Name label maker
76 BUSBUD DOME business bookkeeping system
77 TIMECLK Computes weeks total hours from timeclock info.
78 ACCTPAY In memory accounts payable system-storage permitted
79 INVOICE Generate invoice on screen and print on printer
80 INVENT2 In memory inventory control system
81 TELDIR Computerized telephone directory
82 TIMUSAN Time use analysis
83 ASSIGN Use of assignment algorithm for optimal job assign.
84 ACCTREC In memory accounts receivable system-storage ok
85 TERMSPAY Compares 3 methods of repayment of loans
86 PAYNET Computes gross pay required for given net
87 SELLPR Computes selling price for given after tax amount
88 ARBCOMP Arbitrage computations
89 DEPRSF Sinking fund depreciation
90 UPSZONE Finds UPS zones from zip code
91 ENVELOPE Types envelope including return address
92 AUTOEXP Automobile expense analysis
93 INSFILE Insurance policy file
94 PAYROLL2 In memory payroll system
95 DILANAL Dilution analysis
96 LOANAFED Loan amount a borrower can afford
97 RENTPRCH Purchase price for rental property
98 SALELEAS Sale/leaseback analysis
99 RRCONVBD Investor's rate of return on convertible bond
100 PORTVAL9 Stock market portfolio storage-valuation program

C R DOUBLE S S

Emily G. Johnston

Game programs are fine, but playing games with a computer wears a little thin after a while. How about a program that helps you create a game — a crossword puzzle, to be precise?

First, let me describe the puzzle. Most of you are familiar with a standard American crossword puzzle, in which words are inserted in a matrix diagram so that every letter is "keyed" — i.e., each letter is contained in two words. (English puzzles allow unkeyed letters, which makes them much harder.)

The kind of puzzle I am interested in is quite different — it's called a "double-crosstic" (D-C, for short). In these, the diagram is linear. Each square is numbered consecutively and words are formed along the line, not up and down. Each square has a letter code, which refers to a list of 'words,' and each 'word' has a definition. The puzzle-solver guesses the 'words' from their definitions and fills them into a set of dashes provided. Under each dash is a number which tells you where in the diagram the letter belongs.

When the puzzle is finished, the diagram will contain a quotation, and the initial letters of each 'word' will spell out the author's name and title of the work from which the quotation was taken.

For an example, look in the Sunday *New York Times Magazine* or in the back of any issue of *Saturday Review*. Many Sunday newspapers have them in their magazine supplements, also.

For some reason, these puzzles are rather addictive. I have been working them for years and have become rather expert at solving them (although not as expert as my father, who does them in ink!). Finally, I got the idea to try to make up some of my own.

To understand the creation of a D-C, we consider the problem in reverse.

Choose a quotation. Write down the author's name and title of the source in a vertical list. Anagram the entire quote into a set of words beginning with those letters. Assign the cross-correspondence between letters in the words and letters in the quotation. Draw up the diagram and put all the numbers and code letters in. Think up some definitions for your words, and you are all done.

It's as much fun to make them up as to work them, but there are quite a few

These puzzles are rather addictive. I have been working them for years and have become rather expert at solving them.

complications. It is very easy to miscount the letters. Generating the cross-correspondence is time-consuming and incredibly boring. Another problem is what I call the "end-game" — you get the whole thing almost done only to discover that you are left with two Q's, one R, three I's, and a Z. So, you return six or eight words to the letter pile and do it over. And over, and over. Finally, if you persevere, you will get a collection of decent words.

Professional puzzle-makers use Scrabble tiles to make up these puzzles. They get five or six sets, and put them into a box with 26 pigeonholes. (Go to a hardware store and try to find a box with 26 compartments in it.) Then they construct the quotation using the tiles and lay it out on the dining room table. The

source letter box is put away and another box with 26 pigeonholes is used to collect the letters from the quote. Take out the letters for author-title and put them on the table. Start making up words, forming them with the tiles and putting them on the table.

About the time you are halfway through, the cat jumps on the table and scatters the tiles all over the room! The tiles solve the problem of miscounting or over-looking letters, but that's about all.

After making up a half-dozen or so, I decided that a computer program was definitely in order here. Besides eliminating the cat problem, it can keep a running count on all the letters, tell you when you have used a letter you do not have, compute the average number of letters per word required at any time, and — AND — do the cross-correspondence when you are finished.

There are probably all of four professional D-C puzzlemakers in the whole United States. They get maybe \$50 per published puzzle, and have cornered what market there already is for them. Obviously, none of us are going to get rich off either the puzzles or the program. I wrote to the puzzlemakers I know of asking if there was an interest in such a program. I only got one reply, and he didn't know what the devil I was talking about.

Undaunted, I wrote the program anyway. It's called "DBLX," and it's so neat I have to share it with somebody. The puzzlemakers are too set in their ways to try our stuff, so here is a tool for you to try theirs.

DBLX is written in DEC PDP-11 Basic-Plus and is heavily dependent on the string manipulation features of that language. The code runs about 450 printed lines. The current version contains most of the bells and whistles, but there are a couple of limitations yet to be removed.

Emily Johnston, Director, Computer Center, Western Maryland College, Westminster, MD 21157.

The most severe limitation is that the input quotation can contain a maximum of 256 characters. This is due to the input buffering characteristics of Basic-Plus (and perhaps other Basics, too). This is not really long enough; although most quotations contain about that number of letters, the spaces between words and the punctuation need to be retained for readability, and for the cross-correspondence. There are a number of ways around this restriction, but none of them are attractive to a novice computer user.

Some improvements are also necessary. There is no mechanism yet for changing a word in the quotation in order to obtain one of the letters present in the author's name or title of the work. While this practice is not strictly kosher, it is sometimes done in order to use an interesting quote.

The cross-correspondence algorithm is not very smart either. One of the tacit rules of D-C's is that no two letters from the same 'word' should end up in the same word of the quote. One puzzle-maker to whom I showed the program pointed out that he likes to skip at least three words in the quotation between assignments and counts as words for this purpose things like standard phrases and hyphenated words. Although my algorithm makes a token effort to satisfy this, there are a number of violations.

Ultimately, I would like to add a graphics section which will produce the diagram and the list of blanks for the 'words.' That would eliminate the last piece of drudgery in what is otherwise a very entertaining pastime.

In the following scenario, the quotation has been entered from a file. It is

The puzzlemakers are too set in their ways to try our stuff, so here is a tool for you to try theirs.

possible to enter a complete word list via file also, so that the program essentially gets used just for creating the cross-correspondence. The program that generated this was run on a PDP-11/60 under RSTS/E. I have added a list of my definitions for the 'words' at the end, just for the fun of it. The example is from a puzzle I made up using tiles some time ago.

If you would like to have a copy of the program, please send me a self-addressed,

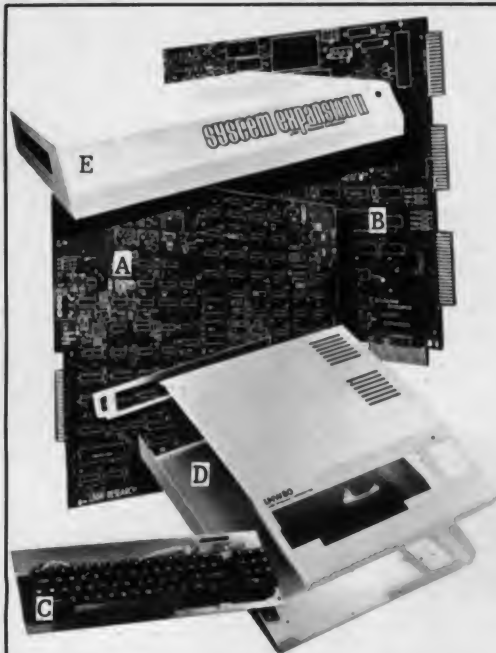

stamped envelope (large), and I will send you a listing. Or, if you have access to it, send a mag-tape (not cassette), format instructions, and enough postage for me to mail it back to you.

My definitions were:

- A. Should you do these on bended knee? (2 words)
- B. Proper compensation, some say. (4 words)
- C. This is an odd number (comp.)
- D. Bubbly.
- E. Do this to your cat and you're in for big trouble. (4 words)
- F. Traveling singing group, popular with country folk. (3 words)
- G. NASA's newest bird. (2 words)
- H. Penn's woods. (3 words)
- I. Philippine city.
- J. But it sounds like the opposite of straight-legged. (2 words)
- K. Site of a college with the same name. (word & abbr.)
- L. Looks OK, but you really can't tell.
- M. Sounds from trains indicate they may use this to control the gears. (2 words)
- N. Bubbly (again).
- O. Something for nothing (colloq., 2 words)
- P. No-good genuine shoe part. (2 words)
- Q. You must ask this before taking any steps. (3 words)
- R. Concurrently. (poetic; contr. & word)

□

COMPUTER KITS – FROM \$69.95

LNW SEMI-KITS can save you hundreds of dollars. By obtaining your own parts at the lowest possible cost and assembling the **LNW SEMI-KITS**, you can have the most highly acclaimed microcomputer in the industry – the **LNW80**. The **LNW SEMI-KITS** are affordable modules. You can start with a modest cassette system and expand to a full 4Mhz TRS-80 compatible system with 5 or 8 inch double density disks and color at any time.

A. LNW80 CPU – Made of high quality FR4 glass epoxy double sided circuit material, with plated-through holes and gold edge connector. It is fully solder-masked and silk screened. Here are just some of the outstanding features you will have when your **LNW80 CPU** board is fully assembled: • 16K RAM • Color and black and white video • 480 x 192 high resolution graphics • 64 and 80 column video • 4 Mhz Z80A CPU • Upper and lower case display • 500 and 1000 baud cassette I/O – **\$89.95**

B. SYSTEM EXPANSION – Expand the **LNW80** computerboard, **TRS-80** and **PMC-80** computer with the following features: • 32K memory • Serial RS232C and 20Ma port • Real time clock • Parallel printer port • 5 inch single density disk controller • Expansion bus (screen printer port) • Onboard power supply • Solder-masked and silk screened legend – **\$69.95** (tin plated contacts) – **\$84.95** (gold plated contacts)

C. KEYBOARD – 74 key expanded professional keyboard – includes 12 key numeric keypad. Fully assembled and tested. – **\$99.95**

D. COMPUTER CASE – This stylish instrument-quality solid steel case and hardware kit gives your **LNW80** that professional factory-built appearance. – **\$84.95** Add \$12.00 for shipping.

E. SYSTEM EXPANSION CASE – This stylish instrument-quality solid steel case and hardware kit gives your **SYSTEM EXPANSION** interface that professional factory-built appearance. – **\$59.95** Add \$10.00 for shipping.

F. LNW80 CPU – HARD TO FIND PARTS KIT – \$82.00

G. LNW80 VIDEO – HARD TO FIND PARTS KIT – \$31.00

H. SYSTEM EXPANSION – HARD TO FIND PARTS KIT – \$27.50

I. LEVEL II ROM set. (6 chip set) – \$120.00

VISA and MasterCard accepted. Add \$3.00 for shipping plus \$1.00 for each additional item. All shipments via UPS surface. Add \$2.00 for U.S. Mail. Shipments outside continental U.S.: funds must be U.S. dollars. Sufficient shipping costs must be included with payment.

RUN DBLX
DOUBLE-CROSSTIC -- VER 1.1

DO YOU WANT INSTRUCTIONS? YES

** DBLX ('DOUBLE-CROSS') INSTRUCTIONS **

DBLX HAS THREE PHASES: 1- QUOTE ENTRY AND INITIALIZATION,
2- WORD ENTRY, 3- CROSS-CORRESPONDENCE ASSIGNMENT.

PHASE 1: IN RESPONSE TO THE PROMPT, TYPE IN YOUR QUOTE.

A MAXIMUM OF 256 CHARACTERS COUNTING ALL SPACES AND
PUNCTUATION IS ALLOWED. SPACES AND PUNCTUATION ARE
NOT REQUIRED. HOWEVER, PHASE 3 USES THE SPACES TO

DECIDE HOW TO ASSIGN THE CORRESPONDENCES. IF YOU

WANT TO SKIP 2 WORDS BETWEEN ASSIGNMENTS, FOR EXAMPLE,
YOU SHOULD ENTER A SPACE EVERY THIRD WORD IN YOUR

QUOTE. IF YOU ARE FAMILIAR WITH THE COMPUTER SYSTEM,

YOU MAY CONSTRUCT A FILE CONTAINING YOUR QUOTE USING

ANY OF THE AVAILABLE EDITORS. THEN, WHEN ASKED FOR

THE QUOTE BY DBLX, ANSWER '@FILENAME.EXT', WHERE

FILENAME.EXT IS THE NAME OF YOUR FILE.

DBLX WILL ASK NEXT FOR THE AUTHOR'S NAME AND THE

TITLE OF THE WORK, WHICH FORM THE INITIAL LETTERS FOR

THE WORDS YOU MUST CONSTRUCT. IF YOU WANT ONLY ONE OR

THE OTHER, ENTER IT IN RESPONSE TO THE 'AUTHOR' PROMPT.

A MAXIMUM OF 30 LETTERS IS ALLOWED. THESE NAMES MUST BE

ENTERED IN SINGLE QUOTES IF THERE ARE ANY EMBEDDED SPACES

CONTAINED IN THEM. SPACES ARE NOT REQUIRED.

AFTER THE QUOTE AND AUTHOR/TITLE HAVE BEEN ENTERED, THE PROGRAM

WILL PRINT SOME PRELIMINARY STATISTICS AND THEN ENTER PHASE 2,

THE WORD-ENTRY MODE.

PHASE 2: ENTER THE WORDS FOR THE PUZZLE, OR EXECUTE

VARIOUS DBLX COMMANDS. FOR A LIST OF THE COMMANDS,

TYPE THE COMMAND '*HELP' ONCE YOU ARE IN THIS PHASE.

ALL COMMANDS ARE PREFACED BY '*' TO DISTINGUISH THEM

FROM THE WORDS. DBLX WILL TELL YOU IF YOU ARE OUT OF

ANY LETTER, IF THERE IS NO INITIAL LETTER FOR THE WORD,

OR IF THE WORDLIST IS FULL. THE '*CHANGE' COMMAND

ALLOWS YOU TO DELETE WORDS AT ANY TIME.

PHASE 3: WHEN THE WORDLIST IS FULL AND ALL LETTERS HAVE BEEN

USED, YOU ARE READY TO HAVE THE CROSS-CORRESPONDENCE

COMPUTED. THERE IS NO DIALOG. WHEN YOU GET THE NEXT

PROMPT, TYPE THE COMMAND '*PRINT' FOR THE RESULTS.

IN RESPONSE TO THE QUESTION 'WHERE?', ANSWER EITHER

'KB' FOR YOUR TERMINAL, OR WITH A FILE NAME.

END INSTRUCTIONS

ENTER QUOTATION - END WITH 'CR' (MAX 256 CHARS)

? @QUOTE2.TXT

QUOTATION IS:

I DO NOT BELIEVE THAT FRIENDS ARE NECESSARILY THE PEOPLE YOU LIKE

BEST, THEY ARE MERELY THE PEOPLE WHO GOT THERE FIRST. YOU ARE

STUCK WITH MOST OF THEM FOR LIFE, OFTEN WITH PEOPLE WHO ARE

ENTIRELY REPRESENTABLE, UNRELIABLE, AND EVEN SPITEFUL.

ENTER AUTHOR'S NAME? 'PETER USTINOV'

ENTER TITLE OF WORK? 'DEAR ME'

THE VOICE OF THE FUTURE . . . HEAR TODAY

Echo Speech Synthesizers

Now your computer can talk with an ECHO™ speech synthesizer from Street Electronics!

Our SPEAKEASY™ phoneme system provides unlimited vocabulary while using a minimum of memory. The TEXTALKER™ text-to-speech firmware allows you to simply type in a word or phrase and let the computer do the rest. With nearly 400 grammatical rules contained in the system, your computer can properly pronounce most correctly spelled words. Simple commands allow you to select from:

- Entire words pronounced or spelled letter by letter
- Different volumes
- Spoken punctuation if desired
- 63 different pitch levels
- Words spoken monotonically or with intonation
- Fast or slow speech output

The applications of the ECHO speech synthesizer are virtually unlimited, ranging from business and education to games to aiding the handicapped. The ECHO II which plugs into the Apple II is priced at \$199.95. The ECHO-GP is a complete stand alone unit which is compatible with most any computer; it sells for \$369.95.

Experience the Magazines of the Future . . . TODAY

for the Atari 400/800

for the TRS-80
COLOR, Ext. Basic

for the APPLE II+

The Programmer's Institute's magnetic magazines will entertain, educate, and challenge you. Each issue features ready-to-load programs ranging from games, adventures, home applications, and utilities to personal finance, educational, and our "unique" teaching programs. Our magazines include fully listable programs, a newsletter containing descriptions and instructions for all programs, and notes on programming techniques used. Magatari and TRC are available on cassette or diskette. Appletree is available on diskette only.

Subscription price for cassette is \$50 per year, \$30 per ½ year and \$10 for a trial issue.
For diskette \$75 per year, \$45 per ½ year and \$15 for a trial issue. . . . Don't miss another issue!

"Received my first copy . . . it's great! Please rush to me one of each back issue, so I'll have a complete set."
R.G., Chicago, IL

"Not only are the games fun and the applications useful, but the quality of the programs is excellent."
S.P., Midwest Computer Software Sales

"(Your magazine) is everything I expected and more!"
P.L., Durand, MI

the programmer's program

The Programmer's Institute has designed a series of programs which examine the innovative use of BASIC commands. By exploring the fundamentals of computer programming, **The Programmer's Program** provides a valuable supplement to the BASIC manual.

Each technique is explained in depth, then graphically displayed, enabling you to gain a better understanding of programming concepts. Such methods as **multiple loops, stacks, queues, graphics, game programming, sorts, trees, boolean logic, and memory savers** are explored, making programming tasks easier and more efficient.

The **Programmer's Program** is ideal for anyone who has ever been frustrated by the manuals! (\$50 cassette, \$55 diskette).

FREE OFFER!

Order both **The Programmer's Program** and 1 year's subscription, and the total cost is only \$75 cassette, \$100 diskette. You will receive our **Haunted House Adventure** (14.95) ABSOLUTELY FREE with any \$75 order. Offer expires September 30, 1982.

**You've invested a lot of time and money into your computer . . .
It's time that investment paid off!**

THE COLOR ACCOUNTANT

The Programmer's Institute introduces **THE COLOR ACCOUNTANT**, the only complete personal financial package specifically designed for the Atari 400/800 and the TRS-80 COLOR computers. This unique package includes:

- | | | |
|-----------------------------------|-----------------------------------|------------------------------|
| 1. Complete Checkbook Maintenance | 5. Payments/Appointments Calendar | 8. Home Budget Analysis |
| 2. Chart of Accounts Maintenance | 6. Color Graph Design Package | 9. Schedule 1040 (Long Form) |
| 3. Income/Expense Accounts | (graphs any files) | 10. Decision Maker |
| 4. Net Worth Statement | 7. Stock Market Analysis | 11. Mailing List |

After the initial setup, **THE COLOR ACCOUNTANT** requires less than an hour of data input each month.

The checkbook maintenance program is the key to the entire package. Once your checkbook is balanced, the checkbook summary file will automatically update the home budget analysis, net worth, and income/expense statements. You can then graph any file, record bills and appointments, make decisions, print a mailing list, analyze various accounts or stocks, and even calculate taxes.

All programs are menu-driven and allow add/change/delete. Each file and statement can be listed to screen or printer, and saved to cassette or diskette.

THE COLOR ACCOUNTANT also comes with 40 pages of documentation that leads you step-by-step through the entire package. This package requires 16K for the TRS-80 COLOR Ext. Basic. The Atari 400/800 requires 24K for cassette and 32K for diskette. (\$75 cassette, \$80 diskette).

FREE OFFER!

Order before Sept. 30, 1982 and you will receive **ABSOLUTELY FREE** Itemized Deductions (Schedule A) and Income Averaging (Schedule G).

STONEWARE'S AMAZING NEW GRAPHICS PROCESSING SYSTEM

Professional quality graphics for the Apple II Plus.

After two years of development, Graphics Processing System is the ultimate in fast, low cost, easy-to-use graphics programs. Graphics Processing System creates and edits images in the same manner word processors work with text.

Graphics Processing System features: **Grid Maker** for working with scale and proportion ■ **Colors** can be mixed and used to color lines, objects and backgrounds ■ **Two Zoom** powers for greater detail resolution ■ **2-D Rotation** to full 360° ■ **Duplication** on screen, to disk, and from disk ■ **Text Capabilities** in upper case A-Z, 0-9, and all characters on the Apple keyboard ■ **Modify or Erase** a portion of an image without having to

- start from the beginning
- **Enlarge or Reduce** images
- **Change Proportions** vertically and/or horizontally
- **Print Overlays** separately and in different colors
- **Accesses 16K RAM** card
- **Compatible** with other Apple HiRes graphics
- **Uses** Apple compatible game paddles and joystick
- **Speaks** directly to the Apple Silentype printer and accommodates graphic dump programs for other printers
- **Professional Version** is also compatible with Apple Graphics Tablet, Symtec Light Pen, Houston Instruments

HiPlot DMP 3, 4, 6 and 7, HP7470A Plotter, Strobe 100 Plotter, IDS 460 and 560 Graphics Printers, Epson MX80 Printer with Graphtrix.

Only **\$179.** for Professional Version and **\$69.** for Standard Version.

Requires 48K Apple II Plus, one or two Apple Disk drives, B&W or color screen, game paddles or joystick. Optional: 16K RAM Card or Language Card, Apple Silentype or other B&W or color printer. GPS is available through leading software distributors and Apple Dealers. Or send check, money order, Visa or MasterCard (include expiration date) to Stoneware Incorporated. California residents add 6% sales tax.

Reg. Trademarks: Apple, Apple Computer, Inc. ■ Symtec: SYMTEC, Inc. ■ HiPlot: Houston Instruments Div. of Haensch & Lomb. ■ HP7470A: Hewlett-Packard Co. ■ Strobe 100: Strobe, Inc. ■ IDS 460 & 560: Integral Data Systems, Inc. ■ Epson MX80: Epson America, Inc.

Valley Bomber

Tim Basham

In this game you are the pilot of a bomber. Your mission is to destroy the valley, but not the mountain. The mountain is depicted with x's and the valley with white spaces.

Press the space bar to release the bomb. Points are given for hitting the valley. If you hit part of the mountain, the points are doubled and subtracted from your score.

The game ends when a bomb misses completely. Press Enter at the end of the game to play again. □

Tim Basham, 6040 Janet, Taylor, MI 48180.

PRO FOOTBALL FANS!

INTRODUCING

THE GOLD EDITION

THE MOST SOPHISTICATED SYSTEM EVER DESIGNED
FOR THE PREDICTION OF PRO FOOTBALL POINTSPREADS

TRS-80 I & III
IBM

After four years of research, development, and testing, **SDL** is proud to present "The Gold Edition" — A system that predicts pro football pointspreads with a degree of accuracy that has never been obtainable until now. From weeks 6-16 during the 1980 and '81 seasons **The Gold Edition** has been a proven **winner in all categories** over the Las Vegas line:

SEASON	FAVORITES		UPSETS		TOTAL		TOTAL GAMES
	HOME	AWAY	HOME	AWAY	HOME	AWAY	
1981 SEASON:	57%	80%	63%	70%	59%	71%	154
1980 SEASON:	53%	67%	70%	66%	61%	66%	154
TWO YEAR AVG:	55%	73%	66%	68%	60%	68%	308

THE GOLD EDITION ALSO FEATURES . . .

- Completely Menu Driven Screens
- Easy to Use Commands
- Accesses One or Two Disk Drives
- Requires Only 10-15 Minutes to Update
- Includes Two Seasons of Data
- Can be Used Year After Year
- Predicts Real or Hypothetical Games
- Predicts Accurate Pointspreads
- Predicts Accurate Over/Under Scores
- Can Generate 20-35 Pages of Analysis Weekly
- Hardcopy Reports Include . . .
 - Full Season Schedule
 - Team Performance Detail Analysis
 - Team Performance Summary Analysis
 - YTD Divisional Standings
 - Computer Prediction Analysis
 - Pointspread Differential Graphing
 - Over/Under Differential Graphing

The Gold Edition provides the highest quality of information necessary to beat the Las Vegas Line — Prove it to yourself — **Order Now**
Retail price includes **The Gold Edition** System Diskette, Data Diskette with two years of data, and over 50 pages of comprehensive documentation with padded leather binding. **\$199.50**

Reliable Business Software

DATASMITH software requires no previous computer experience, so it can be used effectively by your present office staff. The menu-driven systems feature extensive error detection and correction facilities, so they are "friendly" to the user.

- **GENERAL LEDGER.** Everything you need to keep the books. Features easy-to-use data entry and error correction, trial balance, fast post, and a variety of comprehensive reports. Automatic error detection keeps the books in balance. Writes checks and makes journal entries in one operation.
- **PAYROLL.** A very flexible system that adapts to a wide variety of needs. Features Federal, state, and local tax calculations, EI credit, and special pay and deduction amounts. Prints all necessary reports, paychecks, and W-2 forms.
- **DATA MANAGER.** A powerful generalized data management system that lets you define, enter, update, sort, select, and print reports from a database of your own design. Applicable to almost any job where records must be kept, this system can replace literally hundreds of programs.

Put your computer to work with these sophisticated systems now. Programs are available for 48K or larger two-disk systems in your choice of code for Microsoft BASIC-80* under CP/M*, IBM* Personal Computer BASIC, or Micropolis* BASIC.

side...the other side...the

Only one thing really puzzles me about the new Basis computer. That is: when the German firm took the normal Apple II and added a Z-80 and CP/M and an 80-column display, and an RS-232 and a parallel I/O port and DOS 3.3 in ROM all for around \$2000, why didn't they put it in a portable case like the Osborne?

That paragraph represented a brave attempt to pretend that Sinclair's ZX Spectrum is not the biggest news in Europe since Clive launched the ZX81 last year. It is.

What the Spectrum is not, however, is the greatest machine Sinclair could have been expected to launch, even though he has promised the \$100 floppy disk with it.

The machine itself probably looks more impressive to an Englishman than to an American because of the context. Here, the British Broadcasting Corporation sponsored microcomputer has been getting all the attention. First because of its very attractive spec, and second, because of all the foul-ups in getting it into production and distribution.

Sinclair feels that his ZX81 was the ideal micro for anybody who was planning a TV series on understanding computers. He felt that with a few tweaks and adjustments, that machine could have been turned into a colour display machine with nicer features, and for a lot less money, than the design the BBC picked.

And he thinks that he's done it.

For someone accustomed to machines like the Atari 400 and aware of Commodore's new Ultimax game machine, the Spectrum might seem almost ordinary. In Europe, however, the Atari 400 has been priced at unreasonably high levels by distributors, even given the now honourable tradition of overpricing imported micros. And the Ultimax is not yet available.

So Sinclair's claim that his £125 16K machine provides more colour display, better Basic and costs less than half the BBC micro's £300 plus, makes it attractive to many buyers.

Guy Kewney

It has its own faults. It is not quite the slowest machine on the market; there are few slower. Its colour display may be high resolution, but it isn't high definition—a good colour television is wasted on it, and a monitor would only be needed to eliminate what is known as "dot crawl" on the PAL encoding system used in much of Europe for colour TV broadcasting.

As a games machine, it needs a paddle socket, and doesn't have one. Sinclair expects this to be simple enough to do, since he has provided two commands (IN and OUT) in the operating software to do the equivalent of PEEK and POKE to the external port. But simple or not, it isn't there, and will cost extra.

Apparently, it has a BEEP command giving good sound and tone generation ability, but unless the machine is tested in total silence, few can hear it. And while its ability to store programs and data on audio tape may be worlds better than Sinclair's previous machine, the ZX81, all that really proves is how ropery the ZX81 was (is) at tape handling.

No, as the thing stands, it is a threat to the Commodore VIC and apart from that, only to the ZX81. When it starts getting really interesting will be when Sinclair launches his Microdrive.

(Editor's note: See the Fall 1982 Creative Computing Buyer's Guide to Personal Computers, Peripherals and Electronic Games for a review of the Spectrum.)

The Microdrive

The Microdrive is still a matter for speculation only. Sinclair says it is a 100K diskette with true random access, on which it would be possible to run CP/M. That, however, doesn't prove a thing. It could be a tape loop.

Sinclair is known to have been talking to the Hungarian firm which has

announced a three-inch cartridge diskette, selling for around £60 in Britain.

According to the distributors of the Hungarian drive, it was developed in 1974, and the Japanese microfloppy is based on that design. "The reason the Japanese design hasn't appeared in Europe, and the reason it has been held up so long, is that the Japanese have been trying to find a way around our patents," claimed the distributor.

Sinclair's deal with the Hungarian firm fell through when they offered to supply a simplified version of the product for £20, say sources. Sinclair apparently wanted a £12 cost, and so went off to design his own.

These sources say that the Sinclair Microdrive is not a diskette in the conventional sense. Instead, it uses a spiral tracking arm, which takes either 3.5 or seven seconds to traverse the diskette surface from start to finish, and reads serial data.

A cursory look at the bit rate, capacity and other known parameters of the drive would appear to bear this theory out. Until Sinclair files his patents and launches the device, theory is all we have to go on, because he isn't saying.

More Atomic Particles

Back at Sinclair's successful rival, the company that actually did design the BBC micro, the Spectrum is to be emulated. Acorn has named all its machines after atomic particles: the first was the Atom, then the Proton (became the BBC micro) and now the Electron and the Gluon are on the way.

Games players will be interested in the Gluon. It is a cut-down version of the classy BBC micro, in a cheap little box like Sinclair's Spectrum, and without a few of the more expensive BBC features. It will run most software that is sold for its big brothers, and will sell for the same price as the Spectrum.

One thing it will have, however, is a fully "soft" keyboard with every key

programmable to generate whatever character (or in some cases, string of characters) the user desires.

Whether this is all good news remains to be seen. I've had enormous fun playing with Chuck Peddle's machine, the Sirius/Victor, where every key and every displayed character is soft. One careless character sent to screen or keyboard configuration sections of memory, and the most entertaining screw-ups can be arranged—and you don't even need machine code programming experience to succeed! Try using the TYPE command on a few files...

The main thing about the BBC micro, however, is not the fact that the Spectrum and the Electron can be made to mimic its features at half the price, but the fact that it can be turned into the world's first 32-bit microcomputer.

Well, not yet. But sooner than you probably think. National Semiconductor has gone out and told the world that it has a family of new microprocessor chips called the 16000, and that the 16032 has now been selected by a handful of customers for their next generation machinery.

From the perspective of anybody who doesn't know the BBC microcomputer, the concept is probably a yawn. For those who have seen the Tube on the BBC machine, it sounds like tomorrow's world today.

The BBC micro has the ability to turn itself into a "slave" processor, handling disk, keyboard and display operations plus networking and anything else of that nature. Most of these facilities are already arranged in the operating software of the standard machine.

The Torch Tube

At the moment, the Tube is used by a company called Torch, which has plugged a Z-80 processor in as the master. Users speak of this as a very elegant and efficient design, since the BBC micro has a bewilderingly large choice of display modes plus very efficient disk and network handling abilities.

With the National Semiconductor chip, however, the Tube allows the user of a 32-bit microprocessor with a very sophisticated instruction set and a range of languages and operating software due out within 12 months, to start running programs today, using the BBC display and disk routines.

Acorn is so delighted with the success of this notion, that it has decided to extend it to Apple, Commodore and Radio Shack users. They, poor things, cannot use the ultra-high speed Tube for data and control operations; instead they

use an ordinary RS-232 link.

"But we are looking at ways of implementing the Tube on those micros. And if we can do it, we can offer American users a \$3500 upgrade to their systems with Unix, 32-bit file structures, 256K of standard memory, and a hard disk," said Chris Curry, marketing boss of Acorn, recently.

It may not wipe out anybody else, but it should get Acorn into the US within a year.

One little irony to end on: the Osborne microcomputer may be heading for something of a price scandal. It is still selling (quite well) at £1500 including local

taxation. The difference between this and the American \$1800 price hasn't really struck home yet, because people still don't believe the machine can be produced for £1500.

But bulk-buy deals are starting to be talked about, and unit prices of £500 for the bigger orders (for 1500 Osborne 1 machines) make the standard retail price look rather different. And it is only three years since Adam Osborne himself stood up at a hobbyist conference in London, and told delegates they were fools to be conned by US exporters into paying inflated "import" costs on top of the US price. I agree with Adam. □

The Graph Paper

Part Four: End of The Beginning

David Lubar

Last month, we covered basic animation and a bit of page flipping. Rounding out the topic this month, I will discuss collision detection and paddle control and other areas related to animation from Basic. Then we will take a look at some ways to alter the whole hi-res screen from Applesoft.

This will be the last portion of the series to use Basic. Starting next month, we will consider machine language exclusively. It really isn't any harder—just different. Meanwhile, let's get on to those collisions.

Crash, Pow

In almost any game, objects interact, and the program must be able to determine when and where these interactions occur. There are two methods with which I am familiar: coordinate checking and bit checking.

Coordinate checking is rather straightforward. You know the size of each object in your program, and you know its location. To see if one object hits another, you merely check whether their edges are within striking range. A simple example of this occurred in the animation program from last month. Each time the square was plotted, its X and Y locations were checked to see if it had "collided" with the border.

For two moving objects, just subtract the X coordinate of one from the X coordinate of the other and take the absolute value. If this is less than half the total width of the two objects, they are sharing an X location. The same check is made for the Y coordinates. If two objects are sharing some portion of both X and Y, they are touching.

Assume that one object has a width of

10 and another has a width of 8. If the difference between their X coordinates is less than 9 (one half the total width), then they overlap along the X axis. Unfortunately, while this method works well enough for squares, it fails to fully handle objects with irregular shapes. In this case, a bit check is required.

When an object is plotted, you must check whether one of its pixels has been placed on a spot where there is already a set pixel. If so, it has collided with something. If there is more than one possible object with which to collide, the program must make a coordinate check, but at least the existence of a collision has been verified by the bit check.

While Applesoft has no specific command for this, the ROM routines do contain a collision counter. This routine checks each pixel placed on the screen and increments a counter if there has been a collision. The counter is at location SEA (234 decimal), and it is updated after every DRAW or XDRAW.

Any shape drawn at a fixed scale, color, and rotation will always return the same value when placed on a black background. If the number changes, the shape has interacted with something.

The collision counts for DRAW and XDRAW work, in slightly different manners, but each will be constant until there is a collision.

For DRAW, the value is 0 until there is a collision. For XDRAW, the value is equal to the number of pixels in the shape when it is drawn on a black background. Since the collision counter is changed whenever a shape is drawn, its value is only valid for the most recent DRAW or XDRAW.

If you have several objects to plot, the collision count should be checked, or saved for later checking, after each shape is drawn. When we start doing machine language animation, we will develop routines that perform collision checks.

Under Control

All games require player input, usually through the keyboard or with paddles. For paddle control, we will look at the general case of a ship moving at the bottom of the screen. The paddle returns a value between 0 and 255 (though Apple paddles are notorious for dropping out below the high range). Your program can use this number to move objects in three ways: directional indication, absolute positioning, and delayed absolute positioning. In each case, the value of the paddle determines what happens to the X coordinate of the player's ship.

Directional indication breaks the paddle into three divisions. If the paddle is left (counterclockwise) of center, the ship moves to the left. If it is right of center, the ship moves right, and if it is in the central area, the ship stops. A subroutine for this method is shown in Listing 1. It simply uses the paddle value to determine the sign of DX.

Absolute positioning is the simplest method. Here, the X location of the object is based directly on the paddle value.

There are two limitations with this method. First, since the paddle range is only 0-255, the range of X locations is limited to 256 positions. This is no problem if you put a border around the playing field. The other problem is that, in Basic, where the paddle isn't read that frequently

APPLE SPEAKS INTELLIGENTLY!

The people who dared to teach Atari to talk are again challenging the microcomputer establishment with the VOICEBOX Speech Synthesizer for Apple. This low cost intelligent peripheral can speak thousands of words unassisted, generated directly from its firmware ROM dictionary located on its plug-in card. This means that speech, with variable intonation and speed, can be used in any of your apple programs without ever having to bother loading a disk. And, in case you want to expand your dictionary to include unusual words or words in foreign languages, you can easily define them with our 64 phonemes and store them by the thousands on one of the six special dictionaries provided for on our disk.

In addition your VOICEBOX for Apple can be easily coded to sing on key with uniform barlengths and you can store (record) your songs on disk, retrieving and modifying sections whenever you want. With the disk system, you'll also enjoy an educational random sentence generator and graphic speech animation! The VOICEBOX for Apple will run on 32K Apple II with Applesoft or Apple II Plus systems equipped with sixteen-sector disk drives. VOICEBOX for Apple comes with loudspeaker and disk. The Alien Group also makes a less expensive VOICEBOX for Apple with all features (including expandable disk dictionary), but excluding firmware ROM and singing capability. Speaker is optional on this unit.

For Atari users, the VOICEBOX for 16K and up Atari plugs directly into the serial port. No extra cables are needed and no speaker is needed since the speech comes directly over your TV monitor. This unit has all speech synthesis features except singing and firmware ROM.

AL-3001 VOICEBOX for Apple. With firmware ROM, singing capability and speaker \$215.00
AL-3501 VOICEBOX for Apple. Without firmware ROM, singing capability and speaker \$139.00
AL-4001 Speaker for AL-3501 (the AL-3501 will also work with any other speaker) \$15.00
AL-5001 VOICEBOX for Atari \$169.00

All mail orders are on a 10 day moneyback guarantee if you're not completely satisfied. When ordering enclose check or money-order or state VISA or MASTERCARD number. Send mail orders to:

Graph Paper, continued...

the object will appear to jump when the paddle position is changed by a large amount.

This brings us to the third method. In delayed absolute positioning, the object moves toward the absolute position indicated by the paddle, but the movement is in small, fixed increments. For instance, suppose that the X location of the ship is 45. If the next paddle reading is 100, the absolute method would place the ship there. The delayed method would place it at 46, then 47, and so on until it reached 100. Many games use this method, which gives the player a good deal of control. See Listing 2 for an example.

The delayed and directional methods can be modified by adding acceleration. In this case, the object moves slowly at first, then moves in greater steps as it continues in any direction. Accelerating control is good for games where a player might have to make fine adjustments in his position, but might also want to get across the screen quickly.

A joystick is just two paddles. If you want to move an object in both horizontal and vertical directions, use a joystick and treat the X and Y coordinates separately.

The keyboard is used in the directional manner. Press one key to move left, another to move right, and a third to stop. An alternative is to make each keypress produce a small movement. This requires repeated presses on the part of the player, but also gives a feeling of control. The method used depends on the nature of the game.

The best way to read the keyboard is by directly PEEKing location -16384. If the value there is greater than 127, a key has been pressed. The value returned by the PEEK is the ASCII value of the letter. The quickest way to find the ASCII value of a letter is to ask the Apple with PRINT ASC ("X"), where X stands for the letter in question. This is much faster than using a chart.

Listing 1.

```
10 P = PDL (0)
15 REM CONVERT PADDLE VALUE TO
    RANGE FROM -1 TO +1
16 REM WHOLE FUNCTION CAN BE DO
    NE ON ONE LINE BY REPLACING
    P WITH PDL(0) IN LINE 20
20 DX = DX + INT (P / 86) - 1
```

Once the keyboard has been read and a value greater than 127 found, the keyboard should be cleared with a POKE -16368,0. While the choice of which keys to use is up to you, most games use either I, J, K, and M or A, Z, left arrow and right arrow for movement, with the spacebar being used for stopping motion. Most high quality games also allow the user to redefine these keys.

Gun Control

Many readers wanted to know how to program a missile being shot from an object. This month's winning question comes from Michael P. Mariotti, who asks, "How do you fire from one or more points on an object that you are controlling, using as your weapons dots, lines, etc., and hit an object that is also moving?"

There are two parts to doing this: getting the missile started at the proper location, and making it move in the right direction. The starting point of the missile is based on the location of the ship firing the missile and the size of the ship. One way to simplify matters is to define the ship with the nose as the starting point. That way, the coordinates used to DRAW or XDRAW the ship will be the same as those used for the starting point of the missile. If this is not done, you will have to determine how much to add or subtract from the coordinates of the ship to find the starting point of the missile.

Listing 2.

```
1 REM X IS OBJECT LOCATION, DX
    IS CHANGE TO ADD TO X
10 P = PDL (0)
20 IF X > P THEN DX = 1
30 IF X < P THEN DX = - 1
```

Just count the distance from the start of the shape to the firing point, and add the proper offset to each variable. For instance, if a ship has been defined starting in the upper left corner, and the nose of the ship is four pixels to the left and two down from the corner, the X location of the missile would be four greater than that of the ship, and the Y location would be two greater.

A missile is moved just like anything else. It needs a change in X and a change in Y. Using standard Apple screen coordinates if DX is 0 and DY is -1, the missile will move diagonally toward the lower right corner. To speed up the missile, use values greater than 1.

To create a line rather than a dot, you can use HMOVE to start the line, then move it by adding a dot to the front while taking one away from the end. (This is an important concept. If you are moving something that is homogeneous, such as a line, there is no need to move the whole thing. Just lop off one end and add to the other.)

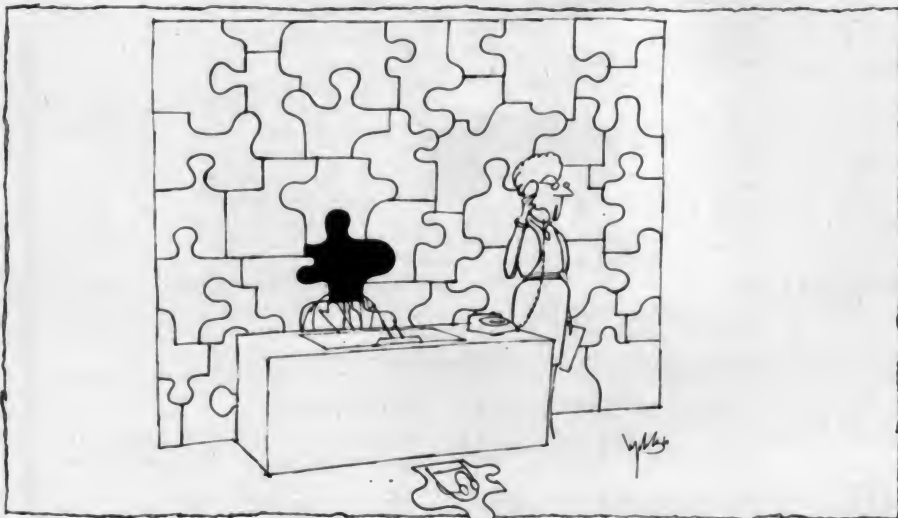

The one problem with using integers for DX and DY is that it gives a very limited number of angles at which the bullet can travel. That brings us to the topic of fractional values.

While you can't plot an X location of 23.5, you can add .5 to an X value. This will produce a change of 1 every second time the missile is moved. A simple program to demonstrate fractional values for DX and DY is given in Listing 3. This concept is used extensively in machine language animation.

A quick way to use fractional values in a Basic program is to put them in an array. Then use the rotation of the ship as an index into the array. For example, if the ROT of the ship is 16, you would use DX=DX(16), the value of which has to be calculated by you (tedious but necessary).

Speaking of rotation, many people wanted to know whether there is any way to prevent the gross distortion produced by rotating a shape. The only way is to use several shapes, defining one shape for each rotational view of the object. Shapes can be reused when the rotation is 180 degrees, but even a 90 degree rotation will produce a slight distortion since the width of a pixel is approximately 1.5 times its height.

All this talk of shapes has brought about the urge to preach. Bear with me for a moment. Shape tables are great for playing around and for doing light-weight

"...can you call back?...he just dropped out..."

7 Good reasons why you should subscribe to *Creative Computing*.

It's the Number One magazine of computer applications and software!

There's one place you can always be sure of learning more about microcomputer software and applications: *Creative Computing*.

Every month *Creative Computing* provides you with a continuing education on everything related to microcomputers and computer equipment. Useful articles, "how to" tutorials, exciting new applications, games and "no holds barred" reviews of the latest software and equipment make up a major part of *Creative Computing*'s editorial content.

We give you probing features on programming breakthroughs and important news. Plus in-depth articles on elementary, intermediate and advanced software and applications topics—to help you develop your knowledge and skills, save hundreds (perhaps thousands) of dollars in unneeded software, discover uses for your personal computer that you might never have considered. Articles that increase your overall "computer consciousness." Here's how:

1 *Creative Computing* gives you things to actually do with a computer.

Just owning a computer isn't enough. You've got to know what to do with it. That's why applications are our primary focus. Text editing, animation, graphics, business simulations, data base and file systems, music synthesis, control of household devices, communications, games—some of the applications and software you'll learn about in *Creative Computing*.

2 *Creative Computing* discusses business applications in simple, nontechnical language.

If you're a business person who needs to know about the latest developments in word processing and office applications, turn to *Creative Computing*. We clarify such business applications as investment analysis, futures evaluations, data base management, mailing list programs, text editing, word processing and simulations. And all the software available for business people.

3 *Creative Computing* helps you decide which computer equipment is best for you.

Our tough, no-nonsense equipment profiles arm you with the facts before you walk into a computer store. You'll know the right questions to ask and how to cut through the jargon and sales hype. We give you authoritative guidance in deciding what you need, what you don't need—and what's right for you and your pocketbook.

4 *Creative Computing* covers computer education in depth.

We started out as a computer education publication, and we're still committed to the educational community. We regularly carry articles on designing educational software, evaluating educational software, teaching concepts and terminology in computer education, text editing applications for literature and computer simulations in the classroom—plus a great deal more.

5 *Creative Computing* brings you hours of mind-expanding game entertainment.

We've got a soft spot for the computer game addict—and computer game software. We know you want to understand more about the new computer games flooding the market: which ones are easiest to learn? Require the most skill? Offer the most surprises? Give you the best graphics? Provide the most challenge? Contain a new twist? *Creative Computing* brings you the answers.

6 *Creative Computing* features the state of the art.

Columns on the most popular personal computers, a "software legal forum," letters to the editor. Reviews of books, games, organizations, dealers and events. Fascinating interviews with leading innovators, equipment designers, program developers and game inventors—men and women who'll give you a real glimpse of the future!

7 Our price is right.

By subscribing to *Creative Computing* now, you can save as much as 33% off the full subscription price. To learn elsewhere what you'll learn from *Creative Computing*, you might spend hundreds of dollars in course fees and books. Then you'd have to winnow out what you could use from all that you'd learned. But *Creative Computing* does that for you, so you'll have time to enjoy your own computing interests. And that saving of time makes this offer very inexpensive indeed.

Join over 150,000 *Creative Computing* readers by subscribing today! Just use the coupon at right.

graphics. The topic is worth covering, and we will see a bit more of it next month when delving into Applesoft ROM routines. But Applesoft shape tables are nearly useless when it comes to doing games with fast animation. They are very slow and very limited. They belong to the past. We will be leaving them behind soon and seeing how to make the Apple do things your way. We will be creating our own graphics subroutines. And once you get a taste of that, there is no turning back. You will be hooked, I promise.

Screening Room

Besides using standard graphics commands, you can manipulate the screen with POKES. Listing 4 changes the hi bits of all the bytes in the hi-res screen. It is a bit slow, but it should give you an idea of what can be done. Remember, each byte on the screen consists of seven bits that are used for plotting, and one that determines color.

Another interesting trick is to turn all on bits off and vice versa. One way to do this is shown in Listing 5. There is

Listing 5.

```

```

undoubtedly a faster algorithm. See if you can find one. This type of manipulation can't help being slow, but it does serve as good introduction to techniques that will be used later in machine language.

Later on, we will redo programs 4 and 5 in machine language as an exercise in translation. For now, see what other effects you can accomplish by POKEing to the hi-res screen.

Odds and Ends

The sine wave program mentioned a few months ago is beginning to haunt me. I promised a version with moving rungs, and will produce it this month, but I must explain the down side of this whole affair.

As I mentioned, the programs were produced during an evening of hacking with a fellow programmer, and the results were interesting. Unfortunately, the disk containing the programs has eluded discovery for the last month or so (suspicion runs high that it was left in a cabin in Lake Tahoe by the aforementioned fellow programmer). Anyhow, I re-created one of the programs, but re-creations just don't ever seem to equal the original.

Listing 6 is a program that does move the rungs of the sine wave. The program was made faster than the one listed several months ago by doing most of the calculation beforehand. While this produces a wait before the first image appears, it reduces the time required from then on. If the disk turns up, I will list some of the niftier variations in a future article. The lesson is obvious; either make backups of everything or don't let your hacking partner go to Tahoe.

Well, that's a wrapup for this month. Next time, we'll dive into ROM routines and begin the trek away from Basic. □

Listing 6.

Will Fastie

I was fortunate enough to attend the National Computer Conference (NCC) this year in Houston, as I did last year in Chicago. Last year I was stunned at the number of Z80- or 8085-based, CP/M compatible computer systems displayed. It just seemed as though everybody had one.

This year was different. This year, everybody seemed to have a 16-bit machine of some description. What really surprised me was that most of these systems were built around the 8088 or 8086 CPU, the same one used in the IBM Personal Computer. Not only that, but of those that did have the 8088/8086, most offered MS-DOS (read IBM DOS) as the operating environment. It looks like the IBM PC has really paved the way.

There were three machines that I found particularly interesting. One is special, and deserves a special mention. It is the Compass Computer, from Grid Systems. It is a 9-pound portable computer that folds into a very small package. A primary size advantage comes from the flat screen which displays a full screen of text or graphics with a 240 x 320 resolution. Nonetheless, it packs a full-size keyboard, 256K of main memory, 256K of bubble memory, integral modems and other communications adapters, the 8086 processor, and the 8087 numerics processor. There were some spectacular (for their speed) graphics demonstration programs running on the machine.

The Compass does not have any mass storage other than the bubble, as it is intended as a remote terminal and pro-

Photo 1. The Wang Professional Computer.

cessor device which connects with central processing systems. All this for only \$8150. I covet one. Just think, I could talk to my IBM Personal from remote locations . . .

The other two systems that impressed me were the Digital Equipment Corporation (DEC) Personal Computers and the Wang Professional Computer. The Wang really caught my eye.

What Wang announced is a small system based on the 8086 with a socket for the 8087. The basic system includes 128K of memory, a monochrome display, and one 320K floppy disk drive. The price of this system is \$3395. A second floppy is \$400. The 8086 runs faster than the 8088 in the IBM PC—8MHz vs. 5. In addition, Wang announced a 5 megabyte, 5-1/4" Winchester hard disk for \$2000!

The system comes with MS-DOS and a user-friendly "shell" which Wang designed. (A shell is a program that "surrounds" the operating system and provides

an interface to it. Wang's is menu-driven.)

So, what we have here is a system which is largely compatible with the IBM PC, but about \$400 lower in price, and faster to boot. It is also (and I hate to admit this as I stare directly into my machine) very attractively styled — more so than the IBM. The price for the hard disk is *incredibly* aggressive, and is sure to set the pace for hard disk pricing from the big companies.

Wang is providing two software packages initially. The first is word processing (what a surprise) which is compatible with other Wang WP systems. The second is the Multiplan spreadsheet program from Microsoft. Both packages are priced at \$500.

The DEC systems simply cannot be ignored because of the company, although my reaction to them is somewhat mixed. DEC actually offered three systems, and not just models, but different *families* of

Photo 2. The DEC Rainbow 100 Personal Computer. (The system unit is not visible.)

systems. The Professional 300 series is based on the PDP-11 instruction set, and I think it is, therefore, most interesting to DEC users as a machine at the low end.

The DecMate II is primarily a word processing system, and is based on the PDP-8 instruction set. (Incredible. DEC just seems to keep selling PDP-8's.) The Rainbow 100 is the "personal" computer offering, and is very interesting.

The Rainbow 100 comes with two processors, the 8085 and the 8088. A special attraction of the machine is the operating system, dubbed CP/M-80/86, which is simply CP/M-80 and CP/M-86 rolled into one. DEC has put the system together so that the software can tell which CPU to use with a feature they call "softsense," which detects which CPU the program requires. Quietly, in the fine print, DEC mentions that MS-DOS is supported. The price of the Rainbow 100 is \$3495. (For an in-depth evaluation of the Rainbow 100, see the November 1982 issue of *Creative Computing*.)

DEC produced a book called *Guide to Personal Computing* and handed out copies at the NCC. Of course, it's really a guide to DEC personal computing, but it is very well done. The book includes a section that explains how things like printers and graphics displays work — topics that are especially helpful for the novice.

There were some interesting announcements at Comdex/Spring in Atlantic City which I learned about just in time for the column. The first was that *Multi-Plan*, a powerful spreadsheet program and the first of the "Multi-Tool" series from Microsoft, is now available to end-users. Previously the package had only been sold to OEMs. However, while a host of computer systems are supported, there is no indication that the tool is available to

owners of the IBM Personal Computer!

Multi-Plan is available for computers based on the 8088/8086 and running MS-DOS, but not the PC? Well, here's what I think this means. Whenever IBM enters into negotiations with a firm about anything, the firm must agree not to discuss the discussions with anybody else. I consider it very likely that IBM will announce the produce soon (if not by the time you read this). I asked IBM directly, and got the standard, but polite, refusal to speculate.

Interesting Comdex announcement #2 is the Hyperion Portable computer from Dynalogue, a Canadian company. The standard system, weighing 20 pounds and including a full keyboard, two 320K diskette drives, a 7" CRT, the 8088 processor, and 256K of RAM costs \$4995. What is really interesting about this machine is the company's claim of full IBM PC software compatibility.

The operating system is MS-DOS, the Basic is Microsoft Basic, the processor runs at 4.77 MHz (same as the PC), the keyboard layout includes all the same keys in a slightly different layout; in short, a tiny IBM PC. The price is even competitive with the IBM, if you factor in reasonably priced memory and communications adapters. This machine will be very interesting to owners of multiple IBM units, such as Fortune 1000 companies, who have a need for portable computers as well.

Why have I spent so much time in an IBM column talking about other computers? Because I'm about to indulge, once again, in

Some Speculation

Here we sit, a little less than a year after the introduction of the IBM PC (that is, at the time of writing), with a market flooded

with competition for the IBM. The Wang in particular, I think, is in a very good position. By many comparisons, the IBM has dulled.

The Wang is aggressively priced. DEC offers the dual-processor as a standard feature. And a host of other companies, including Commodore, Vector Graphic, North Star, Zenith (Heath), Sony, and others less well-known, have introduced systems based on the 8088 or 8086 processor and supporting MS-DOS. To me, it all means just one thing: it is time for IBM to strike.

First prediction: an IBM hard disk, 5 megabytes, in the last quarter of this year. This will probably be the point at which IBM DOS (MS-DOS) Version 2.0 will be announced, and that alone represents an important step forward. (More on MS-DOS 2.0 in subsequent columns, but rumor has it that Microsoft has already delivered Version 2.0 to IBM.)

I hope (and expect) that the disk will be aggressively priced. I would like to see some kind of innovation from IBM here, like a big bubble memory or large quantities of RAM at disk prices, but I guess it will just be a Winchester.

Second prediction: an IBM letter-quality printer before the end of the year. This is certainly an easy task for IBM; they simply have to give up the notion that the DisplayWriter and the DataMaster can be protected. What I would also like to see, but don't think will happen, is a dual-mode matrix printer, one capable of higher speeds (200 cps) for normal printing but very high quality printing at slower speeds (40 cps).

Third prediction: *Multi-Plan* from IBM before the end of the year.

Fourth prediction: 3270 and 2780/3780 emulation hardware and software from IBM, by late this year or early next. I just don't see how IBM can go on for long without having this stuff, because at least half the Personal Computers sold are going into IBM National Accounts, those serviced by the Data Processing Division (or whatever it is currently called).

With that many systems going into companies with installed mainframes, third parties will provide this product if IBM does not, and I don't think IBM wants to appear foolish by not supporting its own big systems, especially when these functions can be touted as "Office Automation" capabilities.

Final prediction: another model of the PC. The two possibilities are a system selling for under \$1000 (maybe even \$500!) and oriented to the consumer market, or a repackaged version, styled and configured to compete more effectively with the likes of Wang and DEC in the \$4000+ market segment. Since IBM has stated their intention to address the business market first

Apple® II's best LISP just got better!

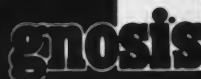

LISP (for List Processor) was developed at MIT in the late 1950's. As one of the oldest languages still in active use, LISP's applications include artificial intelligence, natural language processing, robotics and educational and psychological programming. LISP's unique features give the programmer the power to develop software that goes far beyond the limitations of BASIC or PASCAL.

In use at hundreds of colleges and by many hobbyists around the world, P-LISP has been acclaimed by experts in the field as the best implementation written for the Apple II®.

Now you can get the newly released Version 3.1 at a reduced price. The P-LISP Package includes: P-LISP 3.1, a complete 52-page reference manual, and the specially written P-LISP Tutorial.

Now Only \$149.95 including tutorial

IBM Images, continued...

and the consumer market last, I think the repackaged system is likely by early in 1983. Somewhere in this scenario, I predict that the 8087 Numerics Processor and the big brother of the 8088, the 8086 CPU, will get plugged in.

Well, I went pretty far off the deep end that time. Please, don't keep score!

A Graphics Dump Program

I know what you are thinking. You are saying "Sure, Will. Just like you've been promising since who knows when." Yeah. But I finally delivered.

Listing 1 is my program to dump a medium resolution graphics image to the IBM 80 cps printer with Grafrax-80 or Grafrax-Plus installed, or a similarly equipped Epson MX-80 or MX-100. The program produces a horizontal image on the paper and will produce a printed image of either black and white or color displays.

The technique used by the program is simple. After creating a graphic display, the program uses the Basic function POINT to read the setting of each of the 64,000 dots that make up the medium resolution image. These settings are saved in the array LINES for later printing. They must be saved because the printer prints eight rows of dots at a time, and my program collects information one row at a time. I could have written the program to collect eight points at a time and send that value to the printer, but the technique of saving the data is more conducive to other orientations of the picture, which I will discuss in a minute.

The LINES array is organized as 25 lines of 320 elements. When the collection of data is complete, each element of the array contains the setting of eight dots taken from the eight vertical positions present in each column of each row. This data representation also happens to be just what the printer needs to produce the horizontal picture. It is, thus, a simple matter to place the printer into graphics mode and transmit the lines, one at a time.

Well, not quite. In Version 1.0 of IBM Basic, all PRINT statements interpret the string they print. This is quickly evident when a program tries to LPRINT CHR\$(7). The expectation is that a character with value 7 will be transmitted to the printer, but the effect is that the system beeps (code 7 is a bell character) and nothing goes to the printer. Basic Version 1.1 is supposed to have this capability, but I haven't had a chance to test it.

So to get the data to the printer without risk of interpretation, I had one of two choices. The most obvious (at least to me) was to write an assembly language interface to the printer routine in the ROM BIOS. Although this would have been easy for me, it would have resulted in a fairly cryptic Basic program — one not

Listing 1.

```

1000 ' GPRINT - Graphics Dump Program for the IBM Personal Computer
1010 ' Will Fastie -- Original version Feb 82, revised June 82
1020 '
1030 ' This program transfers the contents of the Color/Graphics Adapter
1040 ' memory to a GRAFTRAX-80 or GRAFTRAX-Plus equipped IBM 80 CPS or
1050 ' EPSON MX-80 printer, to an EPSON MX-100 printer, or to a new
1060 ' generation EPSON MX-80 or 100 printer (for which GRAFTRAX-Plus is a
1070 ' standard feature). Medium resolution images (200 x 320) are
1080 ' converted, whether in black and white or in color. Color
1090 ' images, which can be displayed using a 4-color set, are printed
1100 ' in black and white.
1110 '
1120 ' The program assumes that the program is executed on a machine
1130 ' equipped with the Color/Graphics Adapter only. If both
1140 ' display adapters are present, switch to the Color/Graphics
1150 ' adapter first, then run this program.
1160 '
1170 ' -- Global program declarations
1180 DEFINT A-Z
1190 DIM PIN,MASKS(8)
1200 FOR PIN = 0 TO 7
1210     PIN,MASKS(PIN) = 2^(7-PIN)
1220 NEXT PIN
1230 ESC = 27
1240 CR = 13
1250 '
1260 ' This section should be written to suit your particular needs. For
1270 ' demonstration purposes, it loads a previously stored image from the
1280 ' disk into the memory of the Color/Graphics Adapter. You could
1290 ' generate the image here instead.
1300 '
1310 KEY OFF: CLS
1320 INPUT "Enter filename of image: ",F$
1330 SCREEN 1,0 'Medium resolution, color enabled
1340 DEF SEG = &HB000 'Base address of CG/A memory
1350 BLOAD F$, 0
1360 '
1370 ' This section converts the image in memory to a numeric array
1380 ' containing the information required for the printer.
1390 '
1400 ' -- Declare an array to hold the data
1410 NR.ROWS = 200: NR.COLS = 320
1420 ROWS.PER.PRINTED.LINE = 8
1430 NR.LINES = NR.ROWS/ROWS.PER.PRINTED.LINE
1440 DIM LINES(NR.LINES, NR.COLS)
1450 '
1460 ' -- Initialize the array to 0
1470 FOR L = 0 TO NR.LINES-1
1480     FOR COL = 0 TO NR.COLS-1
1490         LINES(L, COL) = 0
1500     NEXT COL
1510 NEXT L
1520 '
1530 ' This section reads each point from the video memory, translates
1540 ' the points to a black and white representation, and builds
1550 ' the data for the printer.
1560 ' The ROW and COL variables are used to calculate the position in
1570 ' which the point value should be placed. The positions 0 through 7
1580 ' represent the printer's print head pins, from top to bottom. The
1590 ' value in each position in the array corresponds to these pin
1600 ' positions.
1610 '
1620 FOR ROW = 0 TO NR.ROWS-1
1630     L = ROW/ROWS.PER.PRINTED.LINE
1640     FOR COL = 0 TO NR.COLS-1

      ELSE C = N: GOSUB 2000: C = 0: GOSUB 2000
2190 RETURN

```

easily understood. Instead, I opted to use the Basic INP and OUT functions to write a direct printer driver. It is not that the printer output routine is any easier to figure out, but at least it is completely written in Basic without resorting to any assembly language.

The printer routine outputs a single character to the printer by outputting it directly to the hardware printer port. The effect of the five-line routine can be simply described as telling the printer you are ready (the first OUT), waiting for the printer to be ready (the INP in the IF statement), sending the character and telling the printer to take it (the next two OUTs), and finally waiting for the printer to be ready (the final IF statement). This is really a brute force approach, but it works.

By the way, I'm grateful to Donald Johnson of Tonawanda, NY, for sending me his graphics dump program. He also resorted to this approach for the printer, and it was nice to have the confirmation that the technique works.

This program has one drawback: it is pathetically slow. My first version of the program took something like 40 minutes to construct the array and print the image. By carefully rewriting the program, I was able to reduce the time to under 15 minutes. However, this is still terrible. The time can be improved somewhat by resorting to PEEKs to get the screen data, but it will still be slow.

By comparison, the commercially available products which I will describe momentarily can get the same image out in one or two minutes because they are written in assembly language and run

considerably faster than Basic. That single fact makes the available programs worth every penny you pay for them. The slow speed of my program is the reason for the BLEEP statement. It is there to let you (and me) know that the program is still running.

My program is rather simple, but it can be rewritten to produce any of the images

MICRO-Z

Figure 1. Two images printed by Will's program. Hayes is reversed, and somewhat squashed. The Micro-Z logo is printed as a medium resolution image, even though it was saved in high resolution.

the commercial programs can generate. As you will see, those programs can vary the intensity of the print, print vertically or horizontally, and print different sized pictures. To do this, you need only change the way the data read by POINT is stored in LINES and choose the appropriate Epson mode. It may also be necessary to revise the program so that it prints more than one dot per picture element in order to produce an image with the proper "aspect ratio."

Aspect ratio refers to the ratio of the width and height of the image. For example, suppose you drew a square, but the aspect ratio of the height to the width was 1/2. What you would see is a rectangle, half as tall as it was wide.

The problem with the printer is to get the same ratio for the printed image as is presented by the graphics display. I have completely ignored this issue in my program, and if you compare the output from my program, shown in Figure 1, with the comparable output from the commercial programs, you will see the Rutherford Hayes is squashed.

Graftrax-80

One of the things I had to do to write this program and test the four products was to add the graphics capability to my printer. Rick Thomas, of Ratcom, was nice enough to send along a Graftrax-80 kit for me to use.

I thus have the experience of installing the kit in the IBM version of the Epson, and as you can see from the figures it worked just fine. The printer must be opened, a chip removed, and the three Graftrax chips installed. Also, a wire must be cut and the printer configuration switches must be reset.

The Epson instructions were complete and mostly clear. The chips were hard to remove and insert, requiring some patience. If this doesn't sound like your cup of tea, your dealer will probably be willing to help you out.

Once installed, the printer gains not only the graphics capability but some new text functions too. For example, it is possible to embed emphasized print within a line. The standard IBM or Epson printer cannot. Graftrax also offers italics, and many other revised and improved features.

Other Graphics Dump Programs

I tested four programs designed to transfer graphics images to the printer. They are *Videograph 88* from Windmill Software (\$59.95), the *Graphics Hardcopy System* from Versa Computing, *Print-Graf* from Micro-Z Company (\$44.50), and *RatTrax* from Ratcom, Inc. (\$25). These packages share one trait in common, but are otherwise dramatically different. The common trait is speed.

The speed is achieved because the programs are not written in Basic. The code

SOUTHWESTERN DATA SYSTEMS

PROUDLY INTRODUCES ONE OF THE TASTIEST MACHINE LANGUAGE DEVELOPMENT SYSTEMS AVAILABLE...

"THE S-D-S COMBO!"

Whether you're an experienced machine language programmer, or a beginner just learning, Southwestern Data Systems now offers you some of the best programming aids available...

Assembly Lines: The Book

By Roger Wagner

A BEGINNER'S GUIDE TO 6502 PROGRAMMING ON THE APPLE II.

For beginners, **ASSEMBLY LINES: THE BOOK** provides a clear and non-technical introduction to machine language programming on the Apple. Drawn from the monthly column in *Softalk* Magazine, and expanded to provide even more information, **ASSEMBLY LINES: THE BOOK** has already received critical acclaim as the best tutorial on machine language programming available.

Example programs include paddles, sound, disk files and more; all presented with the novice programmer in mind. The book also includes an excellent reference section listing each machine language command, and a sample listing illustrating its most common uses in actual source listing.

SUGGESTED RETAIL PRICE: \$19.95

Merlin

By Glen Bredon

A 6502 MACRO ASSEMBLER

For programmers of all skill levels, we think you'll find that **MERLIN** is the most powerful 6502 assembler available for the Apple, while at the same time being the easiest to use.

IN FACT, WE'RE SO CONFIDENT OF THIS CLAIM, THAT IF YOU CAN FIND A BETTER ASSEMBLER WITHIN 30 DAYS OF PURCHASE, SIMPLY RETURN THE COMPLETE MERLIN PACKAGE FOR A FULL REFUND!

A full featured macro assembler with optional assembly to disk, and use of 'include' files. **Merlin's** editor has word processor-like power with such options as global search/replace, a powerful line editor, and more. The package also includes **SOURCEROR**, a utility to generate labeled pseudo source code from raw binary files, and also **SOURCEROR.FP**, a fully labeled and commented source listing of Applesoft BASIC!

SUGGESTED RETAIL PRICE: \$64.95

munch-a-bug

By Wink Saville

A 6502 PROGRAM DE-BUGGER

To round out the set, we also highly recommend **MUNCH-A-BUG**. This very useful utility provides the means to trace through machine language programs one step at a time. This is very educational to the beginner, and an invaluable de-bugging aid to the advanced programmer. In addition, the same money-back guarantee applies to **MUNCH-A-BUG** as to **MERLIN**!

More than a simple step and trace utility, **MUNCH-A-BUG** includes its own mini-assembler, supports labels, and even conditional trace flags. This means **M.A.B.** can be put in a 'dormant' state, which will later 'pop-up' in the trace mode, only when certain conditions are met. Thus routines within fully operational programs can be tested right at run-time.

SUGGESTED RETAIL PRICE: \$49.95

SPECIAL LIMITED TIME COMBINATION PRICE: \$119.95

THIS OFFER VALID THROUGH OCTOBER 31, 1982. • CALIFORNIA RESIDENTS ADD 6% SALES TAX.

Please ask your local Apple dealer for more details, or write SDS for a sample list of **MERLIN's** commands and a complete product guide of over 20 other outstanding programs!

* **MERLIN** is the assembler of choice of these leading software companies: ARTSCI, INC. • BRODERBUND SOFTWARE, INC. • GEBELLI SOFTWARE, INC. • PROMETHEUS PRODUCTS, INC. • SIRIUS SOFTWARE, INC. • SYNERGISTIC SOFTWARE.

Figure 2. Image printed by RatTrax.

that actually dumps the screen is probably written in assembly language, but could be written in one of the compiled languages. Even so, all the packages have been setup so the graphics printing function can be accessed by a Basic program.

RatTrax is the least expensive of the lot. The MX program, the heart of the system, is written in protected Basic. (A protected Basic program is one which has been saved with the "P" option. It is therefore encoded and cannot be listed or modified.)

All the images produced by *RatTrax* are printed vertically on the screen, and the program provides both density and aspect ratio control. The sample shown in Figure 2 was printed at 960 dots per line, with each picture element represented by four dots.

Ratcom has a unique approach to documentation. A program supplied with *RatTrax* prints two very nice looking pages which can be cut out of the piece of paper and punched to fit in IBM manuals. In fact, the pages are numbered for insertion in the Basic manual. This is very clever, and the two-page result contains all the information you need to use the system.

RatTrax is designed for integration into a Basic program. That part is easy. Running the program is a little tricky — you must have the document nearby so you can tell which function keys do what. It was the only program of the four that did not provide menu selection or ask questions.

Figure 3 shows two images of Rutherford B. Hayes as printed by the *Graphics Hardcopy System* (GHS) from Versa Computing. *GHS* prints its images vertically on the page, and can print a full or quarter size image. I printed the two Hayes images in the 1/4 format, one with normal density and one with double density. A close examination of the image reveals that the density is a function of printing horizontally at either 480 or 960 dots per line. The resolution of the image down the page is constant.

GHS is easy to use, but the instructions must be read fully to be able to exercise the options. The instructions are not as well written as they could be, and nowhere mention what resolution image can be dumped (either, as it turns out). The program is rather poorly human engineered, because it only accepts upper case input

and because incorrect responses to questions result in use of the defaults instead of issuance of an error message. A program called Showoff is included on the disk, but is not mentioned in the documentation. It displays the demonstration images supplied with *GHS*; more sample pictures were supplied with this package than any other.

VideoGraph 88, from Windmill Software, was unique in approach. The main program, VIDEO88.COM, is executed after IBM DOS is running, and "patches" the operating system to include the graphics print capability, increasing the size of DOS by 1873 bytes as a side effect. After that, a dump of the screen can be had at any time simply by depressing SHIFT-PrtSc.

Information is provided in the well-produced document describing how to invoke the function from Basic, another programming language, or the keyboard. All *VideoGraph 88* images are printed horizontally on the paper, and the aspect ratio for this single-sized image appears close to perfect.

Although utterly simple to use, the program has the slight disadvantage of being transient in nature. Every time you turn on your computer, you must remember to run VIDEO88 before you attempt to print pictures. If this is something you do all the time, you can certainly invoke VIDEO88 automatically with AUTO-EXEC.BAT, so it is not too much of a handicap.

Two other slight problems are that the *VideoGraph 88* image is over 8" wide, leaving very little room for margins or binding space, and that the Break key seems to be disabled by the program, making it necessary to use Alt-Ctrl-Del to stop the program once it is in progress.

The package comes with a program called DEMO88.BAS which printed the sample shown in Figure 4.

The fourth program is *Print-Graf* by Micro-Z Company. The program prints vertical or horizontal images. The documentation is excellent and very complete. Operation of the program was simple, and the human engineering was above average. Equipped with these advantages, I managed to have quite a bit of trouble.

The program displays its menus, questions, and instructions in an 80-column format, and appears to use color. I say appears because I use an old 9" black and white television for graphics output, and I had a hard time reading some words which seemed to be displayed in reverse video but were illegible. That was compounded by the poor resolution of my TV for 80-column display. The effect was eyestrain as I tried to make out what the program was asking me. A 40-column display for this program would be a better choice.

Figure 3. Two images printed by the Graphics Hardcopy Systems from Versa Computing.

APPLE HARDWARE 201 838-9027 NEW

THE TACKLER™

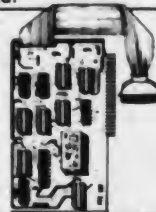

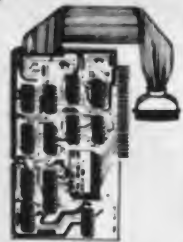

DUAL • MODE PARALLEL INTERFACE FOR
THE APPLE®
2 BOARDS IN ONE FOR NO MORE
COMPATIBILITY PROBLEMS!

An intelligent board to provide easy control of your printer's full potential. Plus a standard parallel board at the flip of a switch — your assurance of compatibility with essentially all software for the APPLE®. Hires printing with simple keyboard commands that replace hard to use software routines. No disks to load. Special features include inverse, doubled, and rotated graphics and many text control features, available through easy keyboard or software commands.

It's simple to print HIRES graphics from an APPLE computer with The Tackler from TYMAC. This is the first truly universal parallel interface! Plus the ROM for your specific printer. Sophisticated intelligence when you need it, total compatibility that never lets you down.

Change printers — no need to buy another board. Just plug in one of our ROM'S and you're all set. ROM'S available for Epson, C. Itoh, NEC, and Okidata — others available soon.

You've asked us to make the TACKLER better than the others and we did. **\$159.00**

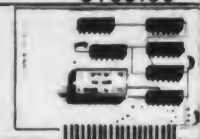

UPGRADEABLE PARALLEL PRINTER CARD

A Universal Centronics type parallel printer board complete with cable and connector. This unique board allows you to turn on and off the high bit so that you can access additional features in many printers. Easily upgradeable to a fully intelligent printer board with graphics and text dumps. Use with EPSON, C. ITOH, ANADIX, STAR-WRITER, NEC, OKI and others with standard Centronics configuration. **\$139.00**

THE PERFORMER PRINTER

FORMATTER BOARD for Epson, OKI, NEC 8023, C.ITOH 8510 provides resident HIRES screen dump and print formatting in firmware. Plugs into Apple slot and easy access to all printer fonts through menu with PR# command. Use with standard printer cards to add intelligence. **\$49.00** specify printer.

THE MIRROR FIRMWARE FOR NOVATION APPLE CAT II®
The Data Communication Handler ROM Emulates syntax of an other popular Apple Modem product with improvements. Plugs directly on Apple CAT II Board. Supports Videx and Smarterm 80 column cards, touch tone and rotary dial, remote terminal, voice toggle, easy printer access and much more. **List \$39.00**
Introductory Price **\$29.00**

DOUBLE DOS Plus

A piggy-back board that plugs into the disk-controller card so that you can switch select between DOS 3.2 and DOS 3.3. DOUBLE DOS Plus requires APPLE DOS ROMS. **\$39.00**

Super PIX

SOFTWARE

The Software package that will allow your printer to dump page 1 or page 2 of the Apple Hires screen horizontally or vertically. Use with EPSON® MX-80 with or without GRAFTRAX® Roms, MX-70 — OKI® Microline 80, 82, 83, 82A, 83A — C. ITOH® 8510 and NEC 8023A. Requires Tymac Parallel Printer Board PPC-100... **\$24.95.**

APPLE LINK — A versatile modem utility that provides the Apple user the ability to transfer disk files and software over the phone. Only one package needed for full transfers. Compatible with all DOS file types. **\$59.00** (requires Hayes Micro Modem)

THE APPLE CARD — Two sided 100% plastic reference card Loaded with information of interest to all Apple owners. **\$3.98**

NEW FOR THE VIC 20®

The Magic Typewriter

A user friendly **WORD PROCESSOR** with full joystick control (use of joystick optional). Easy edit and string manipulation commands that follow the standard VIC 20® format. Full use of function keys for ease of use. **Only \$34.95***

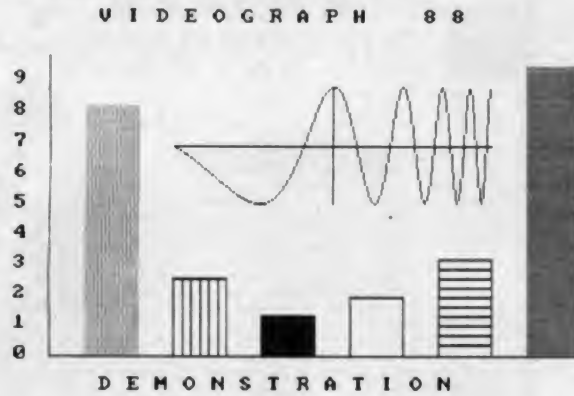

Figure 4. Output from DEMO88, a demonstration supplied with VideoGraph 88.

There are two other complaints. First the program START, which is a menu selection program, does not allow a way back to the operating system. I had to hit Alt-Ctrl-Del to get rolling again. Second, the program only allows two disk drives, which is not a major problem now, but could be in the future as you add more floppy drives or a hard disk.

The Micro-Z software includes the *Print-Graf* program and sample pictures. *Print-Graf* sells for \$44.50. For \$79.50 Micro-Z offers *Print-Graf* with a companion program, *Micro-Graf*. This program is a data plotting package that I think is quite good.

It allows you to enter a set of points and establish the coordinate system, then displays the data points on the graph. Once the initial data entry is complete, several options, such as a linear regression, curve-fitting, and various plotting options, become available. I particularly like the line and curve-fitting routines.

The program displays the graph, and then draws a straight or curved line to show the function which most closely matches that set of data points. The only drawback of *Micro-Graf* is that the data points cannot be saved. The displayed image can be printed or saved, but the work of entering the points is lost.

Three of the packages tested have the capability to print the image as it appears on the screen (white on black) or reversed (black on white). The default is usually reversed, because white on black seems correct for displays, but backwards for paper. *VideoGraph 88* prints only reversed images.

Aspect ratio is handled well by all the packages. The sole exception is the horizontal image produced by *Print-Graf*, which has precisely the same squashed aspect ratio as the image produced by my Basic program. If you compare the Micro-Z image in Figure 5 with the same image printed by my program (Figure 1b) you will see that they are the same size.

It is hard to call any of the four packages superior to the others. They can all do the job, and, with the exception of *VideoGraph 88*, all offer flexibility. All the programs fall in the \$25 to \$45 range, so there is not a great deal of price difference.

The packages impressed me evenly, and none had a significant, special characteristic or capability that would cause me to endorse it. If pushed to the wall, I think I would lean ever so lightly toward either *RatTrax* or *Print-Graf*.

IBM External Software Program

I have already reported that IBM has revised its external software submission plan. This month I received a copy of the 40-page "Software Submission Guide" which IBM has just published. It is excellent. It is well-organized and should provide answers to just about any submission question you may have.

The whole program seems *much* more reasonable. For one thing, the Submission Agreement no longer states that you are bound to enter into a contract with IBM if they accept your software. Instead, the Guide says "... we will offer a Software Contract which will include such items as royalties, advances, and ..." The two key words here are "offer" and "royalties," both of which indicate that the process is now more open to negotiation.

MICRO-Z

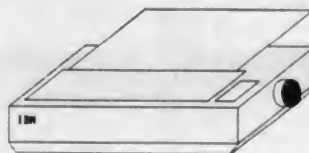

Figure 5. Image from *Print-Graf*. Note the finer resolution as compared with Figure 1. Aspect ratio is not quite correct.

None of this means that IBM will be any less careful or tough, just that they are willing to work something out. That's a step in the right direction.

New Products

Aspen Ribbons carries a broad line of printer ribbons. They offer a ribbon for the IBM 80 CPS (Epson MX-80) for \$8.50, almost half of what I paid for my first replacement from IBM. Aspen will also recycle a used ribbon for \$3.45. I have one of Aspen's ribbons which I will be trying this coming month.

VisiCorp has announced the *VisiFile*, *VisiTrend/Plot*, *VisiDex*, and *Desktop/Plan* programs for the IBM Personal Computer. *VisiDex* is priced at \$250 and the others are \$300. According to the press release, *Desktop/Plan* was supposed to be out in May, but I haven't seen it anywhere yet. The others are due in the third quarter of this year, which should mean by the time you read this.

An Advanced Version of *VisiCalc* was announced for the Apple III and was demonstrated at the NCC. Naturally, I made the appropriate inquiries. I think I can say with some certainty that it will be available for the IBM, but I can't say when. New Apple III features include variable column widths, space between columns(!), more powerful replicate capabilities, on-screen help, worksheet consolidation, and greater on-screen and report formatting capabilities.

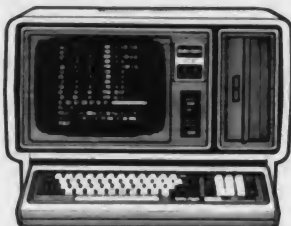

Micro Focus has announced the availability of their family of software tools, including C1S Cobol, Level II Cobol, Animator, Forms-2, and Slideshow, for the IBM Personal Computer. The Cobol compilers have been widely accepted, and the Level II Cobol compiler has recently been certified at the highest level, and with no errors, by the Federal Compiler Testing Center.

Professional Software Inc. has announced *WordPro-PC*, a new word processor for the IBM. Suggested retail is \$395 for the program, apparently a spin-off from the version for Commodore computers. Professional Software claims that over 20,000 copies have been sold worldwide for Commodore systems. Availability is scheduled for September.

The Oasis-16 multi-user operating system, claimed by manufacturer Phase One Systems to be the first for the IBM PC, is now available. Phase One claims direct compatibility with the Z80-based Oasis Basic and C language applications software, making a large body of software immediately available. The system will support Corvus hard disks, and can handle from three to 32 users depending upon system configuration. Phase One offers free applications software directories for prospective OASIS-16 customers. Cost of the system is \$1495.

Go FORTH and Prosper

With Timin FORTH, the unusually fast, elegant and versatile superset of FIG FORTH.

Lifeboat Associates offers this powerful, threaded, interpretive and structured language including a memory resident operating system, text editor, assembler and debugger. This extended FORTH is also enhanced by:

- a visual screen editor with string search and replace
- CP/M-80 file format compatibility
- many additional FORTH words
- array handling (implemented in machine code)
- FORTH assembler for 8080/Z80TM machine instructions
- full floating-point capability

Use this complete interactive software development system to slash software development time and shrink system memory requirements.

For more information about Timin FORTH or any of the other 200+ software packages available for use in professional, personal, and programming environments under SB-80TM or other CP/M® -80 compatible operating systems, IBM PC DOS, or MSTM-DOS (SB-86) contact:

IBM Images, continued...

Information Unlimited Software, Inc. (IUS) announced several programs for the PC. *General Ledger*, *Accounts Payable*, and *Accounts Receivable* head the list, which also includes *EasyPlanner*, a new spreadsheet program. Also available from IUS are *EasyWriter II*, IUS' top-of-the-line word processor, the *EasySpeller* spelling checker, and *EasyFiler*, a record management system.

Strategic Simulations has announced *The Warp Factor*, one of their most popular games, for the IBM PC. The game program costs \$39.95 and requires 64K

of memory. Both IBM display adapters are supported.

Finally, Software Arts, Inc., has broken the silence about their new product, which was demonstrated at the NCC. *TK!Solver* is a program used to solve scientific, engineering, and business problems without programming.

Dan Bricklin says the program will have the same kind of effect upon mathematical problem solving in technical fields as *VisiCalc* has had upon business analysis. *TK!Solver* will be available for the Apple II and IBM Personal Computers late this

year. Software Arts is marketing the product themselves, and will also offer pre-built models in many fields. Early models will include mechanical engineering, architectural design, financial analysis, and high school science.

I got a chance to see a demo of *TK!Solver*. I don't want to over-react before I have a chance to get my hands dirty, but the program looks great. I was very impressed by the demo. (For an in-depth evaluation of *TK!Solver*, see the November 1982 issue of *Creative Computing*.) □

Are you getting the most from your business computer?

Get the best source of information available on microcomputer use:
Small Business Computers

It pays to consult *Small Business Computers* before you or your company expand your software capabilities, look at new peripherals, or even consider your first office microcomputer.

Here's why:

We write only for people who are professionally involved with business microcomputer systems. You won't find any space games or home budget programs in our pages.

Instead, you will find feature after feature on business hardware and software,

You'll also evaluate a wide range of hardware and peripherals, including video display terminals, disk storage equipment, printers (dot matrix and daisy wheel) and modems.

Every evaluation and review in *Small Business Computers* is conducted by our own panel of 21 top computer-science experts. What's more, *Small Business Computers* comes to you from the publishers of *Creative Computing*, the Number One magazine of computer applications and software. All of which means we have the expertise and resources to guarantee that you get the most authoritative, up-to-date analyses and advice available anywhere.

Cost effectiveness: high value plus low price

You can see why *Small Business Computers* will be extremely effective in helping you get the most from a business

computer system. Now for the "cost" part: You can subscribe to *Small Business Computers* for as little as \$14.97 and save 25% off the full 12-issue subscription rate. Or take 24 or 36 issues and save up to 35%!

Whatever your level of involvement with business microcomputers, it makes sense to get the best source of practical information around. Why not take a moment to fill in and mail the coupon now?

plus applications you can use right now, and later as your needs grow.

SMALL BUSINESS COMPUTERS critically reviews a variety of software packages for:

- Accounting
- Word processing
- Data base management
- Business planning
- Financial modeling
- Spreadsheet analysis
- File and record handling

—and much more, from list management to project control.

**Your subscription to
SMALL BUSINESS COMPUTERS may be tax
deductible. Check with your accountant.**

SMALL
BUSINESS COMPUTERS CN 1988, Morristown,

Stephen B. Gray

Reaching for his .44, Jessie shot six holes in the side of the mailcar, one for each station on this month's TRS-80 track: several solutions to high-resolution graphics; the DOSPLUS alternative to TRSDOS; Radio Shack's *Time Manager* program; those old 800 customer-service numbers; the new 817 numbers; and the new Color Computer. Sorry, no room for a short program; back next month.

High Resolution

If you're into graphics at all, you're probably frustrated by the low resolution of TRS-80 black-and-white graphics, which as a consequence are very limited in the degree of detail they can provide. Lines are straight only when perfectly horizontal or vertical, circles aren't really circles, and most three-dimensional graphics are out of the question.

Most of the problem is the large size of the graphics blocks (called "pixels" in the trade, short for "picture elements"); the rest is their rectangular shape. In a space 7.5" across and 6.625" down, Radio Shack has placed 128 pixels across, and 48 down. Thus each pixel measures 0.0586 by 0.138 inch—about the size of the hole in an IBM card—giving it an aspect ratio of 3:7. A much smaller pixel, preferably a square, would be much better for graphics. However, if Radio Shack had provided more pixels, the price of a TRS-80 would be higher, and most users probably aren't interested enough in graphics to want to pay for more than the 6114 pixels they've got now.

For those who want more pixels, there are several ways to get the higher resolution. Two companies sell install-it-yourself boards, Radio Shack offers high-resolution graphics for the Model II, and as I reported in the previous column, Radio Shack will offer a similar option for the Model III later this year. I said the Model III hi-res would be available this fall, but according to the latest information, it may not be until winter. After

all, *SuperScript* was supposed to be available by 12/30/81, according to the RSC-6 catalog; right now Fort Worth is saying June 1982. So please don't bug your dealer or Fort Worth with questions about when you'll be able to get Model III hi-res; it may be a little late.

Let's look at each of the high-resolution systems individually.

Mikeeangelo Graphic System

For \$369, you can raise the resolution of your TRS-80 from the standard 128-by-48 pixels, to 384-by-192 or 191-by-192 if you have a Model I, or to 512-by-192 or 256-by-192 pixels if you have a Model III; you choose the resolution you want via software. That's up to twelve times as many pixels for a Model I, or up to sixteen times as many for a Model III.

This is done with the Mikeeangelo Graphic System, from Mikee Electronics Corp. (Box 3813, Bellevue, WA 98009), which provides 12K bytes of memory in an outboard enclosure that connects to your TRS-80 via a ribbon cable. For the highest resolution, 512 by 192 pixels in a Model III, 98,304 bits are required, which is 12K bytes. Back in 1977, when the Model I was introduced, that 12K would probably have cost you an extra \$290. Not many users would have paid that much for high resolution five years ago.

The manual provides large photographs showing exactly how to install Mikeeangelo, which involves opening the TRS-80, making 18 soldered connections and cutting one trace (or one IC pin). A magnifying glass is supplied, to make sure you leave no solder bridges, and that you've made all the right connections. You also remove the Z80 MPU and plug it into the socket on the interface board. However, unless you've had some experience in soldering IC circuits, you may not want to take a chance on making a mess of your TRS-80, although you may know somebody who can handle the job for

you. There's also the problem of voiding the warranty if you (or your friend) open the TRS-80 case. Furthermore, if your TRS-80 needs repairs later, Radio Shack may first have to remove Mikeeangelo, and will charge for the removal.

A demo tape comes with Mikeeangelo and includes some plotting applications. A driver program allows you to SET, RESET or test (with POINT) every dot; LINE draws a line between any two dots. Inverse video provides black-on-white graphics (Figure 1). Through output port 254, you select normal, high or very-high resolution with or without inverse video.

Once Mikeeangelo is installed, you write programs in Basic or machine language; examples of both are provided, but not enough to really show you what the system can do.

The Mikeeangelo brochure explains

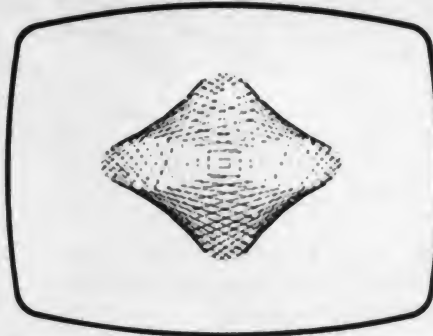

Figure 1. Example of high-resolution graphics, as drawn using the Mikeeangelo board.

why the Model III has higher resolution than the Model I: "The Model III uses an 8 x 12 character matrix instead of the 6 x 12 matrix of the Model I. If you multiply the number of dots along the top of the character cell (eight for the Model III and six for the Model I) by the number of characters per line (64), you get 512 for the Model III and 384 for the Model I. This is the number of dots along the X axis. Next, multiply the number of dots

UNLEASH THE BEAST IN YOUR

TRS-80

With the addition of Dosplus 3.4 disk operating system, your tranquil TRS-80 becomes a wild beast.

Dosplus 3.4 can access information 5-12 times faster than the operating system you received with your TRS-80. Also, it has the uncanny ability to read 40 track disks in 80 track drives. Using Dosplus 3.4 will make your TRS-80 faster, more efficient and easier to use. Simply put, 3.4 will improve your system and increase productivity. And though 3.4 transforms your TRS-80 into a beast of a system, it remains a pussy cat to use. Giving you a higher degree of accuracy control throughout all your operations. Dosplus 3.4 comes with an easy to use operating guide so simple your mother could use it.

So release the beast in your TRS-80, use Dosplus 3.4 disk operating system for a smoother, faster, easier and more accurate way of operating. Now Dosplus 3.4 is just **\$149.95**.

along the side of the character (12) by the number of lines on the screen (16) and you get 192. This is the number of dots along the Y axis. The Model III has a resolution of 512 x 192 dots and the Model I has a resolution of 384 x 192 dots."

Although the Mikeeangelo manual doesn't give enough programming help, there's another source of software for this hi-res system.

Rescom

Bryan Mumford has come up with a number of firsts in TRS-80 software, such as the first disk-cataloging program, the first print spooler, and the first disassembling single-stepping debugger. There's another one, which I've never seen in his ads, the High Resolution Command Module, perhaps because it's very specialized: it's meant to be used with Mikeeangelo.

The first paragraph of the five-page manual for the module says, "The Mikeeangelo high-resolution interface for the TRS-80 Models I and III is a well-come product. It is well designed and gives us excellent graphics capability. It is, however, like any high-resolution system, awkward to use without the proper software. The purpose of this *High Resolution Command Module* (hereafter called *Rescom*) is to add a group of graphics commands to the existing Basic language. There are 14 commands available, and they will greatly simplify your high-resolution programming." *Rescom* is \$24.95 for either Model I or III, from Mumford Micro Systems, Box 400, Summerland, CA 93067.

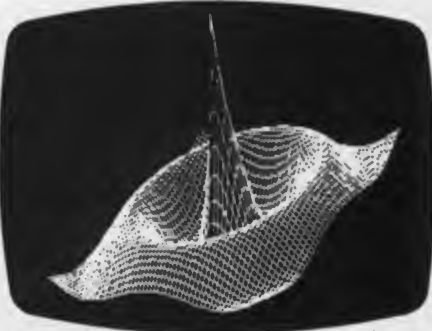

Figure 2. Hires graphics for the Model II TRS-80 provides 153,600 pixels plus eleven new graphics commands in Basic.

Included among the 14 *Rescom* commands are: clear the hi-res memory, turn on (or off) one pixel, test one pixel, draw (or erase) a line from one point to another, draw a line from the present point to the past point, print the hi-res image on an MX-100 (or an MX-80 with Grafrax), select hi-res or mid-res, select reverse (or normal) video. That's 12 of the 14; the other two are involved with

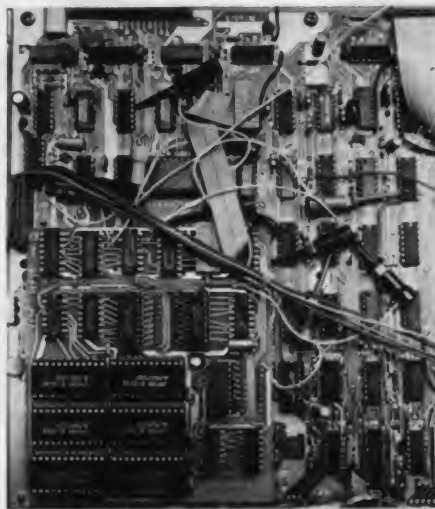

Figure 3. Seven micro-clips connect Micro-Lab's Grafyx Solution board electronically to the TRS-80 Model III's circuit board.

displaying the hi-res memory, or making it invisible.

E/RAM

You may have seen, last year, ads for E/RAM hi-res graphics for the Model-I Level-II TRS-80, offering 256 x 192 pixels, for \$350 from Vern Street Products: The Computer Store in Tulsa, OK.

Those ads disappeared, and were replaced, early this year, by ads for E/RAM for the Model II, at \$495 from Keyline Computer Products (manufacturer of the \$350 E/RAM), also of Tulsa. When the Model II ads also disappeared, I called The Computer Store, and was told, "The designer of the hi-res for the Model II gave up when Radio Shack came out with their own hi-res II. He's looked into hi-res for the III, but it was too difficult, no room."

Radio Shack's Model II hi-res (Figure 2), which provides 640 x 240 pixels (for \$499 plus installation), is their own design, I understand, and so is the forthcoming Model III hi-res.

There's one more source of hi-res graphics for the Model III, and it requires no soldering.

Grafyx Solution

With the Grafyx Solution add-on circuit board (\$299.95 from Micro-Labs Inc., 902 Pinecrest Drive, Richardson, TX 75080), you get three resolutions: high (512 x 192), medium (128 x 192) and low (128 x 96).

There is no soldering with Grafyx Solution, although you do have to cut one trace and remove two ICs from their sockets. Instead of soldering, you clip seven micro-clips onto IC pins; the seven are at the ends of wires connected to the

PC board you install in your Model III's innards (Figure 3).

These clips are the "E-Z" type used to connect test instruments into densely-packed circuit boards. You press the plastic plunger, and a little hook slides out; you hook it onto an IC pin or component lead, release the plunger, and the test-lead is firmly attached, with no chance of flailing around, as can happen when hand-held test-prods slip (and sometimes zap ICs). However, you may not care for the idea of seven micro-clips dangling inside your Model III case. In one instance, the manual warns you to "be sure to keep the plastic clip away from the socketed memory in that corner since some brands of ICs get quite warm."

One more thing: you need a hacksaw. Before you install the Grafyx board, you must make room for it by removing the metal RF shield. Afterwards, you make a cut in the shield and bend back part of it a quarter of an inch, so it's out of the way of the new PC board.

Once you've installed the Grafyx Solution, which contains 12K bytes of additional read/write memory, you use the supplied software to add hi-res graphics to Basic programs (Figure 4). There are commands to enable (or turn off) the hi-res display, clear the hi-res screen without affecting the standard text characters (the hi-res graphics screen is displayed on top of the normal character display), set the desired resolution, plot a point, read point status, draw a line between two points, complement every point on the hi-res screen for an inverse

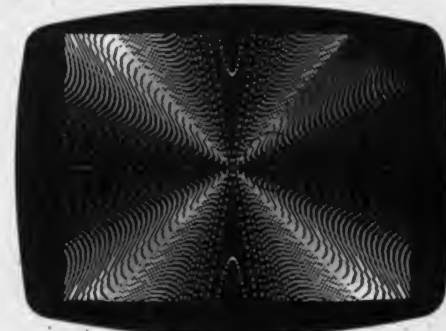

Figure 4. High-resolution graphics using Micro-Lab's Grafyx Solution; note the small size of the dot in this four-way kaleidoscope.

display, copy the contents of the hi-res and text screen to a printer with graphics capabilities, draw a box whose diagonals ends are at two given points, draw a circle with a given radius and center, shade in the shape surrounding a point (half-shade or solid-shade), copy the contents of a screen rectangle into an array, and take the contents of the array and display it at a given position.

TRS-80 Strings, continued...

Eighteen demonstration programs and eight utilities are supplied, along with a program that provides an 80-character display for business forms and word processing. The manual goes into theory of operation and assembly-language techniques, and ends with a list of five graphics programs available from Micro-Labs: *Bizgraph*, *Draw*, *Mathplot*, *3Dplot*, and *PCHAR* (for creating character sets). Only two are priced, at \$34.95 each.

The Choice

So there you have the three choices: Mikeangelo at \$369 with a top resolution of 512 x 192, with soldering but with Rescom software; Grafyx at \$300 with the same top resolution, without soldering but with micro-clips; and, later this year, Radio Shack's own hi-res offering, with an unknown price and resolution. You may want to wait to see what comes out of Fort Worth, but if you can't, you've got two ways to go.

TRSDOS

When you use a TRS-80 without disk drives, the computer is controlled by the internal ROM (read-only memory), which contains the Basic originally written by Microsoft for the TRS-80. The Basic can't be changed without switching ROMs, and anyway, Microsoft Basic is highly efficient. The highly ingenious "tight code" written by Paul Allen and Bill Gates (which was the beginning of the Microsoft empire) takes up much less memory than most (if not all) of the other Basics.

However, when you move up to Disk Basic, you get into TRSDOS, the disk operating system that performs all the housekeeping required to run the system efficiently. TRSDOS, which Radio Shack provides with TRS-80 disk systems, leaves something to be desired. Even Radio Shack has admitted it from time to time, and has had to publish several TRSDOS releases to clear up various goofs. Even then, various features that many TRS-80 owners consider important are missing from TRSDOS, and several software houses have taken advantage of the lacunae.

Three disk operating systems for the TRS-80 were reviewed back in September 1981 (p. 152): NewDOS by Apparat; TRSDOS 2.3 from Radio Shack; and VTOS, which was renamed LDOS by Lobo International. Author Stephen Kimmel noted several "shortcomings" in TRSDOS, remarking that Apparat "had a different answer that was more to my liking," and said VTOS (now LDOS) "is extremely easy to use," having a 40-page operator's guide instead of a 200-page manual. After specifying various features, Kimmel said, "It should be obvious that both VTOS 4.0 and NewDOS/80 offer

significant enhancements on TRSDOS and hence offer more commands.

DOSPLUS

Another very popular TRS-80 disk operating system is *DOSPLUS*, found at computer dealers, or available from Micro-Systems Software (5846 Funston St., Hollywood, FL 33023). *DOSPLUS* 3.3, an older version I started with last year, offered these features:

- **RESTORE:** a KILLED file can be brought back to life with this unique utility, unless you've written over it with another file.

- **DEVICE:** displays on the screen all I/O devices connected to your system, and their driver addresses.

- **FORMS:** goes TRSDOS FORMS several better by adding a value for number of *printed* lines per page and performs top-of-form on the printer, plus several more.

- **CRUNCH:** compresses Basic programs by removing unnecessary blanks and remarks.

- **SPOOL:** permits text printing while enabling the program currently running to proceed to the next step.

- **TRANSFER:** moves all user files from one disk to another.

- **Lower-case detection:** automatically displays lower-case letters if the lower-case mod is installed (on Model I systems).

- **Built-in screen printer:** press two keys (S/P, SHIFT/down-arrow, or SHIFT/CLEAR, depending on model), and the information on the screen will be printed out.

The latest version, at this writing, is *DOSPLUS* 3.4, which includes all the 3.3 features described, and adds a handful more, including a Basic array sort (multi-key, multi-array), random-access and ASCII modification on diskdump, and a dozen more.

DOSPLUS 3.4 is \$149.95, which includes a 240-page manual; you can upgrade from 3.3 to 3.4 for \$49.95.

DOSPLUS Basic

Included in *DOSPLUS* is Disk Basic, which, according to the 3.4 manual, is "a set of enhancements to the Model III ROM Basic, resident upon the disk. It contains features to allow input/output to disk files for data storage and will allow you to load and run Basic programs that are stored on the disk. Disk Basic is completely memory resident on the *DOSPLUS* system diskette, and comes in two forms—Basic and TBasic."

The *DOSPLUS* Basic has extended commands and DOS commands, and is less memory-efficient than TBasic (Tiny Basic), which lacks the *DOSPLUS* system commands and extended features such as extended error messages.

DISASTER INSURANCE.

**PROTECT YOUR HARDWARE
FROM THE UNEXPECTED.**

Not to mention the unavoidable pollutants in the air. Performance robbing dust, grime, spills and static electricity.

Cover Craft Dust Covers help extend the useful life of your computer equipment at a fraction of the cost.

How to make YOUR FORTUNE IN THE MICROCOMPUTER BUSINESS

2 informative volumes containing everything you need to know to establish and build your own profitable microcomputer business. For beginners and those already in business.

Written by a successful entrepreneur in the computer field, **YOUR FORTUNE IN THE MICROCOMPUTER BUSINESS** teaches you how to...

- make the most of a small investment
- avoid costly business errors.
- use practical, proven methods to build your business.
- plan for growth and success.

Volume I: Getting Started includes:

- The right way to generate startup capital
- Your future in the booming software field
- How to develop a sound business plan
- The pros and cons of franchising
- Proven marketing and advertising methods
- Interviews with 6 highly-successful entrepreneurs

Plus all about becoming a highly-paid consultant... or starting your own manufacturing or service business.

Volume II: Growth, Survival and Success includes:

- When to incorporate, when to avoid it.
- Developing sound cash management procedures
- Headache-free employee management
- Profit during a cash crunch
- Your personal plan for consistent and steady growth
- How and when to sell your business

MONEYBACK GUARANTEE

TRS-80 Strings, continued...

The advantage of TBasic is simple, according to the 3.3 manual: "In a 48K machine, after loading in DOSPLUS and TBasic, you will have just over 40K of free memory left for your program. With regular extended Basic you only have about 37K."

DOSPLUS FORMAT

After writing this column on a Model III TRS-80 under DOSPLUS, I use the FORMAT utility to set up a disk for single density, and then copy the column and also the book reviews onto this single-density disk. That's because the Alpha-Comp phototypesetting machine at *Creative Computing* uses output from an LNW80 computer, which is electronically identical to a TRS-80 Model I, and thus requires single-density disks. (This phototypesetting system was described in detail in March 1982, p. 200.)

Yes, TRSDOS has a FORMAT utility, but it's for double-density disks only. DOSPLUS asks, in addition to diskette name, master password, and which drive contains the disk to be formatted, two unique questions: how many tracks do you want, and do you want single or double density. That feature, without which I couldn't write this column in a format usable by *Creative Computing*, and the RESTORE utility, which brings back to life those files I didn't mean to KILL or PURGE, are alone enough to make DOSPLUS worth having. But they're only the beginning. If you use a TRS-80 more than an hour or two a week for anything other than simple programs, try DOSPLUS. You might not need the FORMAT or RESTORE commands, but there are others that are bound to be valuable.

Incidentally, if you see a list of DOSPLUS features in a Micro-Systems Software ad, many of these are identical with

TRSDOS features; the list is partly meant to show how compatible DOSPLUS is with TRSDOS, usually without pointing out which is which. You'll have to compare features one by one to figure it out.

Time Manager

Radio Shack's *Time Manager* is "a personal calendar/reminder and electronic notebook," according to the RSC-7 catalog. It is designed to help you "organize your time and business information, and create permanent records." For \$99.95 you can manage your time and appointments (Figure 5), and track job schedules and costs, as the catalog puts it.

Time Manager "organizes daily schedules, quickly summarizing and displaying appointments, tasks to be done, and project information. It can keep records of expenses or mileage for income-tax reports, document important dates, monitor projects and deadlines, and provide time and expense accounting information for billing or internal reports," according to the press release.

Minimum system requirements are a Model I or III with 48K memory, and two disk drives. Optional equipment recommended includes an 80-column printer, a third disk drive, and an amplifier/speaker

"allowing *Time Manager* to provide audio responses."

The program is quite extensive and includes four diskettes (one with the program, one for data, and two for backups), a 76-page manual, and a reference card containing all the commands and a brief definition of each.

Calendar

First you call up a calendar by inputting the month and day. When the calendar for the month is displayed, a cursor indicates the day selected; it can be moved to any other day by using the four arrows. Using the right and left arrows, in conjunction with the shift key, moves the calendar from month to month.

Time Manager has two levels, Month and Day. To move from the Month (the calendar display), press Enter, and the Day level appears, showing, via the sample data diskette provided, daily-agenda entries (if any) for the day selected by the cursor.

Each entry consists of four parts: priority, permanence, category, and text. Priority has five levels. Permanent entries are holidays, birthdays, etc. Any of 26 categories (A through Z) can be assigned; T is suggested for telephone calls to make, H for holidays, Y for personal items, etc.

CIRCLE 189 ON READER SERVICE CARD

TRS-80 Strings, continued...

The text of an entry can be up to 49 characters long.

Up to 127 entries per day can be put into *Time Manager*, although only 11 will be displayed at a time. A message appears on the bottom line of the screen to tell you how many more entries, if any, are not yet displayed for a particular day. New entries are easily made, or old ones modified.

Figure 5. Using *Time Manager*, this man is scheduling his appointments for next Friday, from "meet with boss at 9 AM" to "call service station."

Now that you've filled out your calendar, you may need to locate an item somewhere on it. To do this, you can select a category, or keyword, or priority, or combinations of the three. Then you can use the automatic scan, which will stop at the first day (forward or backward, as you choose) that contains the type of item you selected.

Totalling and Accounting

Time Manager can also be used for general accounting, and to provide totals for categories such as income received, hours worked and expenses, which sounds like a natural for the self-employed. Up to nine separate accounts can be maintained. Totals for each account can be obtained for a day, a month, the entire year, or any specified time period within the current year.

In the accounting display, there are columns for the account number, account description, sum, multiplier, and total. Running totals are available if desired.

Other Features

With *Time Manager* in Notepad mode, you can fill the screen with miscellaneous information, such as phone numbers, addresses, lists, reports, assignments, etc. Eight Notepad screens are available, along with a screen editor to modify and

display them. Each notepad contains up to 15 lines of 64 characters each.

Two methods of printout are provided. Any of the displays can be transferred to a printer via Screen Printing. To print a Day Level display with more than 11 entries, or to print several displays, or a series of selected entries, Global Printing is available; you select start and end points.

An alarm buzzer can be sounded (if you enter the time in the opening screen) to remind you to make a phone call, for example.

Six "flags" can be set to select special features: uppercase only; expert user (suppresses error messages); etc.

The program can display any calendar page from January 1901 to December 2155, a timespan long enough to take care of the all the appointments for five or six generations. The number of days between any two dates can be calculated.

Entries may be moved from one day to another within a month, or copied from one day to another, or moved from one month to another.

TRS-80 Manager Series

There are more features, but these give you a good idea of what can be done with *Time Manager*, which is designed to "talk" to the other two programs in Radio Shack's TRS-80 Manager Series:

Personnel Manager, at \$99.95, keeps track of people, by organizing employee information. Files can be searched for a specific person, product or service. Data can be organized to evaluate vendors, or employee performance.

Project Manager, also \$99.95, evaluates and schedules projects, by providing TIME, TASK, PERT and GANTT charts. Projects can be viewed graphically with regard to time, sequence, personnel, materials, or resources. The effect each task has on completing the project can be shown, as well as the effects of task changes.

Dates and schedules entered on one of these three interactive manager programs can be transferred to another, updating appropriate information. All three require a 48K two-disk Model I or III; a printer is optional.

About Those 800 Numbers

You may have read, in Radio Shack's *TRS-80 Microcomputer News* for April 1982, that the toll-free 800 numbers for Computer Customer Service were discontinued on the first of June in favor of regular numbers you now have to pay for.

The reason is not because of the cost; the new system will cost Radio Shack more than the 800-number WATS lines. Every time Radio Shack put in more

JANUARY 15, 1982.

TRS-80 Strings, continued...

WATS lines, the volume of calls went up, higher and higher, and even with 57 lines there was the same long wait to talk with somebody. Many of the 800-number calls were "trash calls," from people who wanted to know if they could get a particular item at their local Radio Shack store, or some such question. The new system will hopefully eliminate most of the trash calls, and provide more time to answer "concerned calls," from people with serious questions about their TRS-80 computers.

The 800-number system was expensive, costing Radio Shack well over a million dollars a year. The new way, even though the user pays for the call, will be more expensive for Radio Shack because they've committed themselves to having about 180 people on hand to answer the calls. Radio Shack plans to put a Computer Center "in every major (and many not-so-major) markets in the country," and a Customer Service Representative in most of those Computer Centers, in the hope that users will be encouraged to contact their local service reps who can, if necessary, get help from Fort Worth at no extra cost to the user. If the system works as planned, you should be able to get help for the cost of a local call, with a minimum of delay. That is, if we all limit

our calls to questions about using Radio Shack hardware and software.

Another reason for the change is that many people, and especially businessmen who own a Model II, for instance, would prefer to pay for a call to find out quickly what they want to know, rather than wait 15 or 20 minutes, or longer, on a free 800-number line for the answer.

About These 817 Numbers

Just in case you didn't see the May 1982 issue of the *TRS-80 Microcomputer News*, Radio Shack has assigned area 817 numbers to seven main groups of customer-support personnel:

- (817) 870-2041—Model II/III Business
- (817) 870-2042—Model II/16 Business
- (817) 870-2044—Languages and Compilers
- (817) 870-2150—Color Pocket Computer
- (817) 870-2571—Hardware and Communications
- (817) 390-3302—Educational Software
- (817) 870-2271—Games, Books and New Products

These numbers, which became effective on or before June 1, 1982, are to be called between 8:00 a.m. and 5:00 p.m.

(Central Time) if, as the *Microcomputer News* puts it, "you elect to call us instead of your local Radio Shack Computer Center Customer Service Representative."

The Navy might abbreviate that to COMCENCUSSEERREP, which makes more sense than COCESUSER.

Remember, if we use these seven numbers only when our problems can't be solved by our local Radio Shack store, Computer Department, or Computer Center, the waiting time for help on an 817 line will be kept to a minimum.

New Color Computer

By now you know that the rumors about Radio Shack dropping the Color Computer were only half true. When they recently cut the price of the 4K Color Computer to \$299 from \$399, it was a preliminary to offering the 16K version for \$399.95. Selling a 16K Color Computer for only 95 cents more than the 4K model will, of course, kill sales of the 4K version.

The switch is to bring the Color Computer in line with the competition, such as the \$100 Timex/Sinclair 1000 (only 2K, but the price is right), and the 5K VIC-20 and 16K TI 99/4A (both selling for less than \$300). □

Version
4.0

The Ultimate **APPLE**® Utility Program **COPY II PLUS**

Now you can back up your protected software. Copy II Plus is the most sophisticated bit copy program available. It handles synchronized tracks, half tracks, nibble counting, bit insertion and other protection schemes. It also includes a comprehensive discussion of disk format and protection techniques, and instructions on how to back-up dozens of popular programs. A disk system and speed check assure your drives are running in top condition and a nibble editor will allow you to repair damaged diskettes, analyze protection schemes, etc.

The last DOS utility disk you will need. Fully menu driven, the Copy II Plus utilities include a catalog display with binary file addresses and lengths, a disk usage map, and the ability to verify and compare files for differences. It can copy, lock, unlock and delete files and DOS can be copied, or removed from a disk to free up space. You can change the greeting program on a DOS disk, or initialize a disk from scratch. The Copy II Plus sector editor will allow you to view and modify data in either hex or ASCII format.

For your convenience, Copy II Plus is not copy protected for backup.

THE BIG WHOOPS!

A Cosmocomical Theory of Creation

Peter Payack

Since earliest human times, one of the great unsolved mysteries is the nature and origin of the universe. Now, scientists have put forward a bold new theory which elucidates not only the intricate web of the cosmic-evolutionary scenario but also gives meaning to the enigmatic happenings of everyday life. It links together through computer aided mathematical models, such seemingly unrelated phenomena as black holes and holes in swiss cheese, gravity, condominium and energy conversion, death, the theory of evolution and the birth of Richard Nixon, quasars, and why both half-baked cakes and fully-baked civilizations fall.

The "BIG WHOOPS!" theory, as this daring new cosmological conception is called, contends that every object in the universe has a built-in *whoops!* factor that leads to its eventual downfall in an in-

congruous, if not downright silly, way. According to the theory, this is an inherent component of reality's basic nature which can not be altered in any way. It explains why, when things seem to be going along smoothly, *whoops!*, something happens that messes everything up. Say, an almost inconceivable giant red star, some 500 million kilometers in diameter, farcically collapses into a tiny white dwarf, not more than 20 kilometers across. Or, you are on your way to a close friend's funeral when you slip on a banana peel and rip your meticulously pressed pants. That's the *whoops!* factor at work.

Further, it is postulated that the more massive the material object, the larger and sillier is its potential *whoops!* Therefore, if we were to extrapolate back some 20 billion years to a time when all the matter of the universe was concentrated into a highly compressed primordial globule, you can readily see that it exploded and formed today's observable cosmos because of the *whoops!* factor at its absolute best!

This cosmocomical event can best be visualized by picturing in your mind this preposterous primeval atom as a cosmogonical whoopee cushion which is being blown-up for a party gag. After it has been properly inflated and placed on a chair (preferably under a pillow) one of the unsuspecting guests "sits on it," and in a manner of speaking, lets the air out of the archetypal bag! Only in this singular case the air happens to be loaded with galaxies, pulsars, planets, stars, nebulae, comets, black holes, meteors, quarks and quasars that go hurling into all directions of space, and the universe is brought into being. Who blew it up, and who or what "sat on it" has not been addressed by these scientists who feel that these questions should be left to the realm of philosophical and theological inquiry.

The observations that led to the theoretical foundations of this theory were done at the Mt. Maldermer Observatory, in California, with the aid of its newly constructed 2.50-inch kaleidoscope. □

Voila! The "Star" System

I was looking over the stack of items for review in this column and noticed that some of them are getting a bit old—I haven't enough space to give each item the kind of review I would like to do and have any room for the other items and small programs that I know you appreciate.

The "star" system is rather popular for rating restaurants, movies and tourist attractions: zero stars means the show isn't worth considering, one or two stars indicate that the product is reasonable but nothing special, three stars means good, four, quite good and five stars is superb. So from now on I will take less space for description and use the stars to give you my overall impression of a reviewed item. You can check the advertisements or write the manufacturer if you want more details.

While we are at this, note that *Creative Computing* has a *Software Buyer's Guide* which covers quite a few products and is worth reading.

PetChess *****

If you have been reading this magazine during the past two years, you know that David Levy wrote a column on computer games and how to program them, particularly games requiring some skill and thought to play. Mr. Levy went further and helped produce *PetChess* which is by far the finest chess program for the PET I have seen. I expect it will stand up rather well in the microcomputer chess tournaments.

PetChess from ACT Ltd. comes as a set of two tapes which hold versions for Basic 1.0, Basic 2.0/Revision 3.0, Basic 4.0 and the 8032 models of the PET. You will need a full 32K machine to load *PetChess*. Once started, *PetChess* draws a chessboard and the men, and awaits your commands. The instruction book is clear and concise and includes the FIDE Laws of Chess followed by the program.

All of the features you would expect of a chess program are present. This includes the entry of moves, the placement of pieces for problem solving, backing up if you blunder, displaying the square numbers, and setting playing level. An especially nice feature is the *H which displays the list of available commands at any point in the game. The 8032 version also displays the previous 20 moves at the right of the board for your reference.

PetChess is excellent for the amateur player—so get it! I do have some "wish for" items for the chess buff. They include: storage of the game or board position to the disk for later recall, a chess clock for timed games, and a dump of the current game to the printer.

I am a moderately good chess player, but *PetChess* can beat me consistently at Level 4, and unlike many chess games, it does quite well in the endgame where some deeper looking ahead is needed. When you first start, use Level 0 or 1 which plays very aggressively but with no foresight. Then work up to the level that suits you. *PetChess* is a very fast player—Level 4 takes about 30 seconds per move. It sells for about \$50.

If you write software, take a good long look at *PetChess*. Sometimes a program can be written for the user rather than the programmer; *PetChess* is a good example.

PET Nuke Fix

Donald Barker reports that the PET Nuke program has a WAIT statement which prevents PET Nuke from working on the Basic 2.0/Revision 3.0 and 8032 machines. The offending line is:

```
5311 WAIT 59410,4,4:POKE216,23:
PRINT:PRINT BL$;GETZZ$;RETURN
```

Mr. Barker provides this fix:

```
Delete 5311
5320 GET ZZ$:
IF ZZ$="" THEN 5320
5325 POKE 216,23:PRINT:
PRINT BL$;
5330 RETURN
```

I do not use the WAIT statement, because the PET will not respond to the Stop key while doing the WAIT statement. If the desired event does not happen, the PET remains stuck in the WAIT state.

If you have Basic 2.0/Revision 3.0, try exploring the results of WAIT 6502,n where n is from 0 to 255. This is for Basic 2.0/Revision 3.0 owners only.

CP/M for the PET *****

The universe of Commodore computers is rather like a ghetto in that we tend not to notice what is going on with other personal computers. The Apple and

Move up to Microsystems

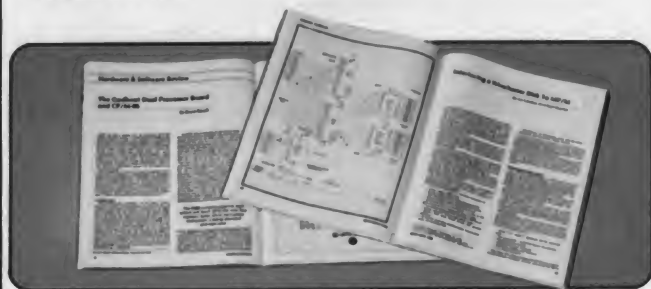

**THE JOURNAL FOR SOPHISTICATED
MICROCOMPUTER USERS.**

Microsystems is not, in any sense, for beginners. Unlike "personal computer" magazines, *Microsystems* is written *exclusively* for expert users and designers in the software and support hardware field.

If you need a reliable, high-level, up-to-date journal devoted to CP/M,[®] MP/M,[®] MS-DOS,[™] UNIX,[®] XENIX,[™] OASIS and other operating systems, then *Microsystems* is for you. We feature tutorials on the modification and special use of systems, offer short-cut routines, show you debugging procedures, techniques for interfacing, and much more. Our one purpose is to keep the advanced microcomputer professional at the leading edge of DOS development and use.

In a few recent issues of Microsystems you would have seen:

- Reviews of four C compilers: BDS C, Small C, tiny c TWO[™] and Whitesmiths C.
- A programming style comparison: Digital Research PL/I-80[™] vs. Microsoft BASIC.
- Twenty-seven 16-Bit DOS compared.
- Virtual segment procedures under UCSD Pascal.
- An in-depth look at MP/M-80 II.[™]
- A simple 6-byte hexadecimal ASCII conversion routine.
- Using CP/M's undocumented "Autoload" feature.
- An explanation of double density disk controllers.

- A comparison of five popular S-100 disk controller cards.
- OS-1—a UNIX-like DOS with a CP/M adapter.

Every issue of *Microsystems* keeps you at the forefront of the industry in customizing software and adapting hardware to meet new requirements and standards. You'll also find industry news, book and new product reviews, plus our regular *Software Directory* listing newly available programs.

To get the high-level systems information you want, join the club of serious microcomputer professionals who subscribe to *Microsystems*. Use the coupon below to order, and save up to 33%!

PROFESSIONALS PLEASE NOTE:

PET, continued...

Atari are rather like distant cousins, and who ever heard of the Z-80?

There is an enormous world of machines and software for the 8080 and Z-80 processors, and most of it uses the operating system known as CP/M. The only practical way to get a PET or other 6502 based machine to run 8080 code is to get an 8080 or Z-80 and attach it to the PET. The Softcard by Microsoft does the trick for Apples by hooking a Z-80 into the Apple bus. There is a catch with this for PET owners, however: most CP/M applications demand at least 48K of RAM.

Small Systems Engineering has built the Softbox which is a unit about the size of a large textbook (it fits nicely on top of your disk drives with room to spare for the ventilation holes in the top of the case) which contains a Z-80 processor running at 4MHz, 60K of RAM, 4K of ROM (which holds the CP/M BIOS), an IEEE 488 bus port, an RS-232 port and a Corvus hard disk port.

To use the Softbox, you simply plug it in to the IEEE 488 bus, insert the CP/M system disk and do the usual DLOAD "...". A program is loaded from the disk into the PET which then activates the Softbox. The usual CP/M prompts appear on the screen, and the CP/M world is open for your pleasure. The Softbox actually does all the CP/M computations while the PET serves as a terminal.

SSE has about 25 of the standard CP/M software packages, including Wordstar and DBase, available on PET disks at present. Since several CP/M bulletin boards are now offering CP/M software via the telephone lines, the use of a modem lets you obtain some 3000 public domain programs for your Softbox.

As with all CP/M systems, the main problem is to get a diskette in the format you can use. The Softbox uses the Commodore disks with a modified format. You can backup the diskettes, but otherwise you must run CP/M to change the contents of the disks. SSE of course provides the master diskette for the packages they sell in PET format, so you are limited to their selection and prices at present. I expect this situation will change rather rapidly.

SSE has written a rather concise and clear introductory manual to help you get started with CP/M. There are several books which go further into CP/M and an incredible amount on CP/M in publications such as *Microsystems* and *Data-cast*. The Softbox, which costs \$895, carries my highest approval.

VIC Bits

I have a few letters inquiring about VIC Basic. The best way to look at a VIC

is to see it as a Basic 2.0/Revision 3.0 PET with a rather funny screen and memory map. I suggest that all VIC owners get some of the manuals for the PET such as the Osborne book, *PET/CBM Personal Computer Guide*. If you skip entirely the material on disks and Basic 4.0, what remains will help you quite a bit with your VIC.

The VIC disk drive arrived on my desk a while ago, and I am rapidly discovering that the VIC disk is identical in operation to a Basic 2.0/Revision 3.0 PET operating a 4040 disk drive sans a drive number. For example, if you want to get the disk catalog, you enter: LOAD "\$0",8. The PET/4040 owner would have entered LOAD "\$",8 where the 0 refers to the drive #0. If you have the VIC disk, locate a 4040 drive owner who has Basic 2.0/Revision 3.0 in his PET and ask questions.

In many ways the VIC situation today is identical to the PET situation about two or three years ago. I suggest that you look at back issues of PET newsletters and personal computing magazines circa 1979 to 1981. Much of the material you find will apply to the VIC. My June '82 column compares Basic 4.0 to IEEE 488 commands for PET disks. The IEEE 488 commands will work on your VIC, so take a look.

When the PET disks first arrived, the complaints about the oddness and tediousness of the disk commands were loud and frequent. As the VIC disk becomes popular, I expect the same hue and cry will arise. Eventually the "DOS Support" (or *Wedge*) came along to make life bearable, and *Disk-O-Pro* finally provided the Basic 4.0 commands for us hapless 2.0/Revision 3.0 owners. A cartridge with the *Wedge* of VIC-O-Pro is a very sensible idea. Will somebody please make it? Your product will get an immediate review.

The Single Disk Glitch

If you have the 2031 single disk drive and a Basic 2.0/Revision 3.0 machine, you may have found a bug in your Basic 2.0/Revision 3.0 ROMs. When you read a file from the disk, some of the characters will be missing. The exact reason for this is obscure and beyond the scope of this column. Willi Kusche has provided these patches:

```
4C ED FF EA
AD 40 E8 29 FB 8D 40 E8
A9 5F 4C 87 F1
```

The catch, of course, is that these patches are in your ROM, so you must make an EPROM to replace your \$FOOO ROM. Willi will provide a ROM for \$15. If you prefer, Skyles Electric Works will also provide this ROM for \$50.

DiscSavers ***

Isn't it annoying when a friend hands you a diskette with good programs on it, but without that protective paper envelope? Or perhaps you bought a box of discount diskettes which came sans jackets?

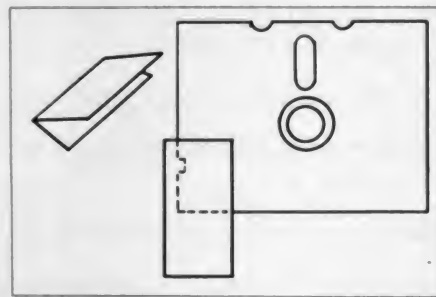

RockRoy offers colored vinyl disk sleeves to protect and help you keep your disk collection in order for about \$.60 per sleeve. The colors are red, green, yellow, and blue.

Since RockRoy is the manufacturer, ask your dealer to place an order for you. You can buy boxes of 12 in each color or "assorted" which is three each of the four colors for \$6.29. My *** rating means that the DiscSaver is a good product, but not an exciting one.

A Write Protect Trick

If you have the 2020 or 4040 disks, or the 8050 with the Tandon drives (These look like the Shugarts used on the 2020 and 4040) there is a simple trick to temporarily write-protect an often used diskette. Take a 3x5 card and fold it in half lengthwise. Then put your diskette in the fold as shown in Figure 1 and put the whole works into the disk drive. Your disk is now write protected while you do copy or backup operations. Take care to not let the card go more than about 3/4" past the write enable slot, and don't try a larger card which may cover the hole used to detect the rotation of the disk.

Figure 1. Folding a 3 x 5 card to write-protect a diskette.

Fold the 3 x 5 card lengthwise as shown and put the diskette into the folded part of the card. Insert the works into the disk drive. Be sure the card does not cover the index hole.

Asteroidz and Munchman *

Guess which two popular arcade games these two from ComputerMat are modeled after. You get one guess. Both of these programs run on an 8K PET (both ROMs) and are simplified versions of the arcade games Asteroids and Pac-Man. In one sense it is quite a challenge to fit a good representation of an arcade game in an 8K PET, but to do a good job you

CREATIVE COMPUTING PRESENTS...

COMPUTER BOOKS!

Basic Computer Games

A complete anthology of 101 favorite games and simulations, each complete with sample runs, program listings and description. All games run in standard Microsoft Basic and are easy to use with any computer. There are games just for fun, to develop logic strategies, to teach environmental solutions, to simulate athletic competition, to play alone or with a group. Edited by David Ahl with illustrations by George Beker. Large format paperback, 200 pages.

#6C....Basic Computer Games...\$7.95 (\$1.50)

More Basic Computer Games

Here are 84 new Microsoft Basic games to challenge you! Includes program listings, sample runs, and a Basic conversion table to make these games easy to use on any computer. Edited by David Ahl and Steve North, illustrated by George Beker. Large format paperback, 200 pages.

#6C2....More Basic Computer Games.....\$7.95 (\$1.50)
#6C4....More Basic Computer Games/ TRS-80.....\$7.95 (\$1.50)

Computers for Kids

An easy-to-understand, step-by-step approach to programming for kids. Everything from what a computer is and how to create a flowchart to writing simple games and drawing pictures that move. Also a section of helpful hints for parents and teachers, and detailed lesson ideas. An excel-

lent elementary introduction. By Sally Greenwood Larsen. Large format paperback.

#12G....Computers for Kids/Apple \$3.95 (\$1)
#12H....Computers for Kids/TRS-80 \$3.95 (\$1)
#12J....Computers for Kids/Atari...\$3.95 (\$1)
#12S....Computers for Kids/Sinclair \$3.95 (\$1)

Computers in Mathematics

Whatever grade you teach, you'll find plenty of ways to approach mathematical concepts in *Computers in Mathematics*. Here are 134 articles and applications written for *Creative Computing* by math teachers. Flowcharts, programs, and sample runs. Over 250 problems, puzzles and programming ideas on everything from simple binary counting to multiple regression analysis and differential equations. 224 pages, large-format paperback book.

#12D....Computers in Mathematics.....\$15.95 (\$2)

The Best of Creative Computing

Articles, learning activities, fiction, games, programs, reviews, cartoons and puzzles from *Creative Computing*. Volume 1 includes computer applications in education and recreation. Volume 2 includes languages, programming theory and artificial intelligence. Volume 3 includes features on technology, public access, medical applications and computers in music. 300+ pages per volume.

#6A....Vol. 1, Best of Creative Computing.....\$8.95 (\$2)
#6B....Vol. 2, Best of Creative Computing.....\$8.95 (\$2)
#12C....Vol. 3, Best of Creative Computing.....\$8.95 (\$2)

PET, continued...

must write the entire thing in machine language.

Asteroidz is better than *Munchman* both in speed and responsiveness. It also has several levels of play with the novice level quite easy to master. It took me some time to clear the screen at the expert level. The asteroids do not make smaller ones. Instead, they get smaller as your shots knock off chunks of them (breakout and asteroids?). One flaw is that your shots slow down the action, and if you have several shots on the screen, their range is quite short. Once the screen is cleared, the game is over.

Munchman is written entirely in Basic and is quite slow as a result. I never was able to clear the board, though I did get close. The drawback will be especially discouraging to novice players. The board does not have the "pass thru" found in *Pac-Man* and I noticed that the direction keys were ignored at times, so I got eaten even though my finger was on the correct key.

Winning these games is a challenge in its own right, but don't expect the kind of action you find at the arcades. I also wished for a joystick option on the user port, as many of my mistakes consisted of pressing the wrong key—my attention is on the screen, not the keyboard. *Asteroidz* and *Munchman* sell for \$12.95 each.

Pakjana ***

I first noticed *Pakjana* in an article on "Object Languages" such as Smalltalk and Logo. A property of these languages is that you can easily define new procedures which immediately become part of the language. To solve a problem, you build a series of procedures which can be executed simply by typing their names. Then you combine these into other procedures and eventually you have constructed a special language of your own from these building blocks.

Pakjana draws a dancer which you can command to perform different actions, on the PET screen. For example, if you type UP, *Pakjana* (The dancer's name) will move up one step. UP 3 moves him up three lines. Nine kinds of faces can be selected by HEAD n, for example, HEAD 8 will make *Pakjana* smile. Similar commands exist for arm and leg movements.

The fun begins when you start joining commands together. REPEAT lets you repeat a sequence of actions such as REPEAT 3 (UP 2 LEFT 4) which makes the sequence in parentheses happen three times. A more powerful command is TO which lets you define a sequence as a new command in *Pakjana*. For example, you can set TO WAVE as LEFTARM 3 LEFTARM 4, and WAVE will then be a command like any of the others. WAVE 3 will wave the arm three times.

Some simple utility functions such as LIST and EDIT provide a minimal means for looking at and modifying commands. You can TAPESAVE your work for later TAPELOAD. HELP summarizes the commands available other than the ones you have defined.

I like *Pakjana* very much. It is a good way to introduce newcomers and children to computer language. Alas, a few bugs prevent me from assigning four or five stars. One of the faces, HEAD 3, leaves the nose at the edge of *Pakjana*'s face; when another face is selected, *Pakjana* has two noses.

The face and arm commands do not provide symmetrical sets of right and left positions. For example, HEAD 3 looks to the dancer's right but there isn't a similar look to the dancer's left. RIGHTARM 7 is not the mirror of LEFTARM 7.

The most annoying bug is that *Pakjana* requires at least two dances to be performed before you can TAPESAVE your work. If these problems were fixed, I would give *Pakjana* a four-star rating.

Since I usually use the disk, I made the modifications in Figure 2 to use DISKSAVE and DISKLOAD instead of TAPESAVE and TAPELOAD. If you get *Pakjana* and make some improvements, I would like to see them. If you aren't afraid of a few bugs, get this program.

Pakjana, which costs \$2.50, comes with a program listing, an introductory manual that kids can use and several pages which describe the operation of the program. Bill Finzer would like to see this program on other small computers, and so would I.

Filemaster ***

If you have owned a disk drive for more than six months, you know what happens to disks: they collect programs. Whatever method you use to keep the programs in order will soon cease to apply

when you are in a hurry and save a program on the first disk that comes to hand. Inevitably the day comes when a cleanup job must be done.

The PET COPY command is then your workhorse, but it is clumsy to use and requires much typing. This is where *Filemaster* from Software by Sasso shines. When you load *Filemaster*, it starts up automatically. (This neat trick involves saving the program via the monitor with some values on the stack which when loaded fool the PET into thinking it is running the program.) You then insert your source disk in drive #0 and the recipient disk into drive #1. The directory is read and several options are presented. You may select the files to be copied from the directory on the screen.

The complete directory is shown, including scratched and botched files. *Filemaster* will attempt to restore damaged files and will let you unscratch a file if it is still intact on the disk. A bad file will be read until it can't be read further, and then placed in a sequential file for your further manipulations.

I have found *Filemaster* rather handy when I have to reorganize my disk collection, and I expect that you will too. *Filemaster* is a good utility and a bargain at \$30.

A Yeech Program

If you have the Fat-40 or 8032 Pet, and want to bug somebody, try this little gem:

```
10 REM IRRITATION
20 FOR J=1 TO 255
30 POKE 231,J
40 PRINT CHR$(7);
50 NEXT
```

The function of location 231 will become painfully apparent in a few seconds. Variations on this theme are:

```
30 POKE 231, 255*RND(J)
30 POKE 231, J*RND(1)
```

```

Steve Gray, et al.

Practical Guide to Computers in Education. by Coburn, Kelman, Roberts, Snyder, Watt and Weiner. Addison-Wesley Publishing Co., 266 pages. 1982.

This book, written by a group of computer educators, is aimed at school administrators, teachers and parents with an interest in the potential and the limitations of working with computers and children.

Practical Guide to Computers in Education is a clearly written work and an excellent resource for people just starting out on the quest for straight information about educational computing. From the onset, the style of the book encourages the reader to relax because, even though computers can be overwhelming, the authors are knowledgeable, experienced and committed to making the journey pleasant.

The book provides a concise and well-organized forum which covers practical as well as philosophical questions relating to computers in schools. It discusses broad ranging questions such as: Is computer education a fad? How will computers transform schools and the way students learn? Will computers widen the schism between the haves and the have nots? Also included are more pragmatic questions such as: What do you want to do with the computer? Which computer should you buy? And how will you know a good educational software package from a poor one? These points and others are all crucial in the overall decision to include computers in a school.

The authors, all affiliated with a non-profit educational organization called Intentional Educations, Inc. are not a bunch of banner waving computer fanatics who, in their haste to proselytize, gloss over important issues and philosophical considerations. Neither does the reader get the impression that they are convinced that computers are the panacea for the American educational system. Instead, *Practical Guide to Computers in Education* offers a balanced view of educational computing.

The presentation of an objective viewpoint is critical during a time when schools are under pressure to continue high standards of education in spite of drastically shrinking budgets. Through the effective use of true life vignettes, the reader is permitted to peek into several schools where community pressure forced administrators to jump blindly on the computer bandwagon only to find that in some cases not only weren't all their problems solved when the computer arrived, but many new ones were created.

One thing that would improve an otherwise fine book has to do with its extremely undramatic visual presentation. At first glance it really doesn't appear to be a very exciting book and because of this, some of the people who could most benefit from the contents might not bother to read it. Perhaps some monochromatic highlighting or some more original photographs and illustrations would give the potential reader a better idea of the high level at which this book is written.

views...book

Dramatic pizzazz notwithstanding, *Practical Guide to Computers in Education* is a realistic look at what can and cannot be done with computers in schools. It should be required reading for anyone who finds himself as part of the decision making process to purchase computers. The authors have been through it all themselves and leave the reader with this pearl of wisdom: "Listen very carefully and don't believe everything you hear." —Annie Fox

Basic Basic—English Dictionary for the Apple, PET, and TRS-80, by Larry Noonan. Dillithium Press, Beaverton, OR. 153 pages, paperback \$10.95. 1982.

This is a great idea, a book to help people translate Basic programs written for a computer other than their own. The idea is quite simple (although writing the book involved an incredible amount of attention to detail): an alphabetic listing of all the commonly used Basic commands, showing how to implement each command for the three computers involved.

The author wrote the book because all three computers are used in his school in Canada, and after a while, "It became obvious that there was a need for something that would help students, teachers and other computer users recognize the similarities and differences among the three Basic languages used by these computers," the introduction says.

Part I is a dictionary of commands, functions, statements and operators used in the three Basic dialects. For example, under CHR\$, we're told that this function is used only in Applesoft (not Integer Basic) but that it can be simulated by creating a string with all the ASCII characters, and an example is given. CHR\$ is used in PET Basic, and reference is made to "Appendix A for special ASCII characters to be used with CHR\$ on the PET." As for the TRS-80, CHR\$ "is used only in Level II Basic," and details on this usage are given.

Some statements can't be translated, of course; this includes Apple's FLASH command, which to put on the TRS-80 requires adding program lines to make the display switch back and forth from white-on-black to black-on-white.

Part II is a ten-page summary of terms, in table form, "for quick reference when more detailed information is not needed." Five appendixes supply ASCII codes, abbreviations of Basic words, details on the three graphics systems, reserved words, and Boolean operators.

If you're interested in translating programs from one of these three computers to one of the others, get this book.

Understanding Your VIC, Volume I: Basic Programming, by David Schultz. Total Information Services, Inc., Box 921, Los Alamos, NM 87544. 146 pages, paperback \$11.95 (plus \$2 for first-class shipping and handling). 1981.

More accurately, this is a book about programming the Commodore VIC-20. The preface says it "is intended to supplement the reference manuals provided by Commodore" and "is not a Basic programming guide, but rather a tutorial presentation of how Basic works on the VIC." Hmm: a fine distinction.

3D Graphics

from **Metaresearch, Inc.**

More software for your hard dollar.

'3DRB' Disc **\$59⁰⁰**
for **APPLE II**

- Arbitrary 3-Dimensional Hi-Res Rotations
- Full ASCII Graph Labeling for Hi-Res
- Stereo Red/Blue 3-D Animation Games, Experiments

'VGR.1' Cassette **\$29⁰⁰**

Spanish

for the Traveler™

A PRACTICAL & EASY METHOD FOR LEARNING (OR BRUSHING-UP ON) SPANISH USED BY TRAVELERS.

ADVENTURE, FUN, EDUCATION, and history are all reasons people travel to other countries. The problem is, when traveling to countries where little or no English is spoken, how to communicate. By spending a few hours with *Spanish for the Traveler*, you can gain a basic understanding of Spanish and at the same time provide yourself with a MAGIC KEY which will open doors to the local culture not normally available to the average traveler. In a Latin country, anyone who tries to speak the Language is almost always treated with a smile and warmth by the people of that country. The way to gain this edge is to practice Spanish with *Spanish for the Traveler* before your trip. . .

Because:

- It's a quick and easy way to learn Spanish useful in traveling.
- It's an opportunity to learn some of the basics of Spanish without the necessity of attending classes, lectures or listening to endless records.
- It's presented in a manner which catches your interest immediately and encourages you to continue building your Spanish vocabulary.
- It provides you with the essentials of Spanish necessary to make your trip as enjoyable as possible. With emphasis on Spanish required for Your arrival, Shopping for Souvenirs, Seeing the Sights, Touring the Country, Dining Out and Getting Acquainted, almost every situation is covered.

Package includes:
diskette, 4 audio cassettes, and take-along manual.

System Requirements:
48K Apple II / II+ with DOS 3.3
and audio cassette tape player.

views...book re

Nevertheless, the author starts out with calculator mode, then moves on to input/output, getting information into the program, data, cassette usage, branching, IF, subroutines, strings, subscripted variables, program design, color, and sound. Appendix A gives listings of six programs (mailing list, number conversions, logical functions, color demo, and sound demo). The color and sound demo programs, on cassette, are \$7.95 (plus \$1 postage). Appendix B gives a simple 20-page backgrounder on data processing, from bytes to logical operators.

Many examples are given; because the text is typed, the author distinguishes between what is typed on the keyboard, and what is read on the TV display, by using a T or R before every line in every example. Monotonous, but it's the easiest way. Exercises are scattered throughout the book.

This is a good guide to VIC-20 programming in Basic, with plenty of helpful examples, and much attention to detail. However, some beginners may get bogged down in the chapter on program design, in which the author felt constrained to get into pseudo-code, which may confuse more than simplify things for some.

Number Treasury: A Source Book of Problems for Calculators and Computers, by Stanley J. Bezuska and Margaret Kenney. Dale Seymour Publications, 198 pages, 1982.

Number Treasury is a math teacher's dream book as well as a young mathematician's math book. (All math novices and math phobics should exit here.) It is designed as a resource for high school math teachers and gifted junior high students and contains a wealth of mathematical knowledge. Within its covers, *Number Treasury* provides a quick overview of number theory with concise definitions of everything from prime, perfect and Fibonacci numbers to the lesser known but equally intriguing lucky and happy numbers.

The layout of the book, though not exciting, is consistent throughout. Each section includes an explanation of the laws governing each kind of number, followed by examples and problems to be solved. The predicatability and conciseness are appropriate for the subject matter, and the format makes it very easy for a teacher to skim through the pages and choose problems for students to solve.

One criticism of *Number Treasury* lies in the insinuation of the subtitle that somehow the book relates to computers and calculators. It doesn't. Although it is true that a teacher with programming knowledge could direct students in the creation of computer generated solutions to the problems, the book itself makes no mention of how this might be done. A teacher who doesn't know programming would find it impossible to learn or teach anything about computers from the information presented here. It simply was not designed to be used with computers or calculators at all and it is misleading to imply that this is another of the new "computer math" books. *Number Treasury* is, however, a good book. In conjunction with the input of a creative instructor it could be used (with or without computers) very effectively. —Annie Fox

Compu-Guide: A Consumer's Guide to Small Business Computers, by Martha Eischen. Dilithium Press, Beaverton, OR. 164 pages, paperback \$14.95. 1982.

Based on the author's one-day seminar titled "Do You Need a Computer?," this slim volume is packed with advice to the person seeking a small computer for business applications.

The author starts out by discussing what a computer can do (save labor, reduce costs, improve work quality, etc.) and can't do (eliminate jobs, reduce personnel, eliminate paperwork, correct current procedures, etc.), asks the reader if he really needs a computer, then gets down to defining objectives, assessing requirements, performing a study, and keeping the staff happy. She pauses to give a chapter on DP terminology, then gets into Choosing the Right System (a look at the various parts of a system), Hardware and Software Contracts, Your System Today and Tomorrow (expandability, transportability, etc.), Installation and Implementation, The Personal Computer, and ends with an appendix consisting of questions to answer, and blanks to fill in with data, as part of a feasibility study.

The book is crammed with common-sense advice and basic information, written very clearly and concisely. Its major drawback is the drawings, which are cartoons in the style of Helen Hoskinson's somewhat confused ladies that once appeared in *The New Yorker*. Many are amusing, but all are poorly drawn, and instead of offsetting what the author (or publisher?) may have felt was rather technical material with a little humor, the cartoons add more of a frivolous touch than anything else. Forget the cartoons—read the book.

An Introduction to Microprocessors: Experiments in Digital Technology, by Noel T. Smith. Hayden Book Co., Rochelle Park, NJ. 182 pages, paperback \$10.95. 1981.

The back cover says this is a "learn-by-doing" guide to the use of ICs that "provides a foundation for understanding the underlying hardware actions of programming statements."

The first chapter, an Introduction to Digital Technology, covers the theory and manufacture of integrated circuits, and also tells how to build the breadboard needed to perform the experiments in the subsequent chapters; or you can buy a commercial breadboard.

The first experiments are with logic gates (NOT, AND, OR, NAND, NOR), then you move on to synchronizing circuits (flip-flops, multivibrators, timers, clocks, triggers), clocked logic, data manipulation and display, data processing (with a Motorola MC14500B), and multibit microprocessors (using a Motorola MC6802). Appendixes describe an alternate breadboard design, and provide IC pin-out diagrams that identify which pin connects to what IC input or output line. No indication is given of the cost of the breadboard or ICs required for the 35 experiments.

Smith writes simply and clearly, and goes into great detail. The experiments range from determining the output of an OR gate, to designing a program for BCD subtraction. This looks like an excellent way to get hands-on experience with computer hardware, down at the gate level. □

SWEET-TALKER, IT GIVES YOUR COMPUTER AN UNLIMITED VOCABULARY.

As Featured in Garcia's Circuit Cellar,
Byte Magazine, September 1981

The Sweet-Talker voice synthesizer allows you to add speech of unlimited vocabulary to your computer. Utilizing the Votrax SC-01A chip, you can output any message by programming individual phonemes. Comes in two versions, one plugs directly into your Apple II, the other connects to any computer with an 8-bit parallel printer port + 12 volts and + 5 volts required for parallel board.

- | | | | |
|---|-------|--|-------------------------------------|
| • Contains 64 different phonemes accessed by a 6-bit code | ST01 | Sweet Talker Parallel Port Board A & T..... | \$139.00 |
| • Automatic and manual inflection modes | ST02 | Sweet Talker Apple II plug in board..... | 149.00 |
| • Parallel port driven or plug-in compatible with Apple II | ST06 | Text-to-Speech algorithm on disk for Apple II..... | 35.00 |
| • Super text-to-speech algorithm on disk for Apple II. Makes Sweet-Talker equivalent to units 3 times the cost. | SC01A | Votrax Speech Synthesizer chip..... | 70.00 |
| • On board audio amplifier | | 5 or more..... | 55.00 each |
| • Sample program on cassette with Apple II board | UPS01 | Universal Power Supply A & T..... | 35.00 |
| • Optional power supply for parallel board | | | Add \$2.00 for shipping & handling. |

UNIPROM

THE VERSATILE EPROM HANDLING SYSTEM

• Reads programs 2704, 2708, 2758, 2508, 2516, 2716 (single supply), 2532, 2732, INTEL'S 2732A and the 8755A (INTEL/NEC) with no personality modules required! All power is derived from the S-100 bus, all signals are S-100 compatible. Port mapping occupies NO memory space.

• An on-board wait-state generator allows use with bus clock rates exceeding 6mhz., with no loss in performance.

• All software is 8080/8085/280 compatible and is fully CDOS and CP/M compatible. Software includes "menu" command, "intelligent" EPROM read/write and disk I/O commands, and functions usually found only in "monitors" and "debuggers".

UNIPROM board (A & T) with extensive documentation, including source listings — \$199.00

UNIPROM disk-based software with source on disk and listing (specify 5.25" or 8" CDOS or CP/M, or NORTHSTAR 5.25" CP/M) — \$38.00

UNIPROM EPROM-based software (2532) \$55.00.

NOW AVAILABLE CRT STAND FOR XEROX 820 SAM

FINALLY, A GOOD LOOKING QUALITY STAND
ENABLING XEROX 820 USERS TO ELEVATE
THE CRT, ALLOWING THE KEYBOARD TO FIT
UNDERNEATH THE CRT WHILE IMPROVING
COOLING AND HEATING AIR CIRCULATION.
TRIANGULAR SHAPED TO GIVE MAXIMUM
SUPPORT USING LESS DESK SPACE THAN
THE CRT ITSELF. STRONG ENOUGH TO AL-
LOW USER TO PUT DISK DRIVES ON TOP OF
THE CRT, REDUCING DESK SPACE NORMALLY
REQUIRED.

**THIS STAND MAY BE USED WITH ANY CRT DE-
VICE AND WILL ELEVATE THE CRT 3 3/4". WITH
ADDED FLEXIBILITY TO USE VARIOUS SIZED
LEVELER INSERTS INCREASING HEIGHT OF
STAND.**

*Manufacturer's suggested retail price Mar. 1, 1982

Read the chart and see why COMPUTE! Magazine¹ calls the VIC-20 computer "an astounding machine for the price." Why BYTE² raves: "...the VIC-20 computer unit is unexcelled as a low-cost consumer computer." Why Popular Mechanics³ says "...for the price of around \$300, it's the only game in town that is more than just a game." And why ON COMPUTING INC.⁴ exclaims: "What is inside is an electronic marvel... if it sounds as if I'm in love with my new possession, I am."

The wonder computer of the 1980s. The VIC-20 from Commodore, world's leading manufacturer of a full range of desktop computers. See the VIC-20 at your local Commodore dealer and selected department stores.

REMEMBER:

MORE THAN JUST ANOTHER PRETTY FACE.

Says who? Says ANSI.

Specifically, subcommittee X3B8 of the American National Standards Institute (ANSI) says so. The fact is all ElephantTM floppies meet or exceed the specs required to meet or exceed all their standards.

But just who is "subcommittee X3B8" to issue such pronouncements?

They're a group of people representing a large, well-balanced cross section of disciplines—from academia, government agencies, and the computer industry. People from places like IBM, Hewlett-Packard, 3M, Lawrence Livermore Labs, The U.S. Department of Defense, Honeywell and The Association of Computer Programmers and Analysts. In short, it's a bunch of high-caliber nitpickers whose mission, it seems, in order to make better disks for consumers, is also to

make life miserable for everyone in the disk-making business.

How? By gathering together periodically (often, one suspects, under the full moon) to concoct more and more rules to increase the quality of flexible disks. Their most recent rule book runs over 20 single-spaced pages—listing, and insisting upon—hundreds upon hundreds of standards a disk must meet in order to be blessed by ANSI. (And thereby be taken seriously by people who take disks seriously.)

In fact, if you'd like a copy of this formidable document, for free, just let us know and we'll send you one. Because once you know what it takes to make an Elephant for ANSI...

We think you'll want us to make some Elephants for you.

ELEPHANTTM HEAVY DUTY DISKS.

For a free poster-size portrait of our powerful pachyderm, please write us.
